## Chapter 1

# LCMAPS - Local Credential MAPping Service

### 1.1 Introduction

This document describes the LCMAPS API and the LCMAPS plugins. Please check the links above.

### 1.2 the LCMAPS Interfaces

1. The interface to the LCMAPS credential mapping framework is described in [Interface to LCMAPS \(library\)](#)
2. The LCMAPS plugins should use the LCMAPS API described in [The API to be used by the LCMAPS plugins](#)
3. The interface that the plugins should provide to the LCMAPS framework is described in [The interface to the LCMAPS plugins](#)

### 1.3 The LCMAPS plugins

A description of the LCMAPS plugins can be found here ...

... the basic plugins:

1. [posix enforcement plugin](#)
2. [ldap enforcement plugin](#)
3. [localaccount plugin](#)
4. [poolaccount plugin](#)

... the voms-aware plugins:

1. [voms plugin](#)
  2. [voms local account plugin](#)
-

3. [voms poolaccount plugin](#)
4. [voms localgroup plugin](#)
5. [voms poolgroup plugin](#)

... miscellaneous:

1. [afs plugin](#)
2. [Job Repository plugin](#)
3. [dummy OK plugin](#)
4. [dummy NOT OK plugin](#)

# Chapter 2

## edg-lcmaps Module Index

### 2.1 edg-lcmaps Modules

Here is a list of all modules:

Interface to LCMAPS (library) . . . . .	<a href="#">11</a>
The API to be used by the LCMAPS plugins . . . . .	<a href="#">12</a>
The interface to the LCMAPS plugins . . . . .	<a href="#">13</a>

---

## Chapter 3

# edg-lcmaps Data Structure Index

### 3.1 edg-lcmaps Data Structures

Here are the data structures with brief descriptions:

<a href="#">cred_data_s</a> (Structure that contains the gathered (local) credentials en VOMS info) . . . . .	15
<a href="#">lcmaps_argument_s</a> (Structure representing an LCMAPS plugin run argument) . . . . .	18
<a href="#">lcmaps_cred_id_s</a> (Structure representing an LCMAPS credential) . . . . .	19
<a href="#">lcmaps_db_entry_s</a> (LCMAPS data base element structure) . . . . .	20
<a href="#">lcmaps_plugin_dl_s</a> (The lcm maps plugin module structure) . . . . .	21
<a href="#">lcmaps_vo_data_s</a> (Structure that contains the VO information found in the user's gss credential)	23
<a href="#">lcmaps_vo_mapping_s</a> (Structure that contains the VO information string (or FQAN) and the local Gid it is mapped to) . . . . .	25
<a href="#">plugin_s</a> (Structure holds a plugin name and its arguments, as well as the line number the plugin is first mentioned) . . . . .	26
<a href="#">policy_s</a> (Keeping track of found policies) . . . . .	27
<a href="#">record_s</a> (Structure is used to keep track of strings and the line they appear on) . . . . .	28
<a href="#">rule_s</a> (Structure keeps track of the state and the true/false braches) . . . . .	29
<a href="#">var_s</a> (Structure keeps track of the variables, their value and the line number they are defined on)	30

---

## Chapter 4

# edg-lcmaps File Index

### 4.1 edg-lcmaps File List

Here is a list of all documented files with brief descriptions:

<a href="#">_lcmaps_cred_data.h</a> (Internal header file of LCMAPS credential data) . . . . .	31
<a href="#">_lcmaps_db_read.h</a> (Internal header file of LCMAPS database reader) . . . . .	32
<a href="#">_lcmaps_log.h</a> (Internal header file for LCMAPS logging routines) . . . . .	34
<a href="#">_lcmaps_pluginmanager.h</a> (API of the PluginManager) . . . . .	36
<a href="#">_lcmaps_runvars.h</a> (API of runvars structure) . . . . .	39
<a href="#">_lcmaps_utils.h</a> (Internal header for the LCMAPS utilities) . . . . .	41
<a href="#">evaluationmanager.c</a> (Implementation of the evaluation manager interface) . . . . .	43
<a href="#">evaluationmanager.h</a> (Evaluation Manager interface definition) . . . . .	46
<a href="#">jobrep_test.c</a> . . . . .	??
<a href="#">jobrep_test.h</a> . . . . .	??
<a href="#">lcmaps.c</a> (The LCMAPS module - the local credential mapping service) . . . . .	47
<a href="#">lcmaps.h</a> (API of the LCMAPS library) . . . . .	48
<a href="#">lcmaps_afs.c</a> . . . . .	??
<a href="#">lcmaps_arguments.c</a> (LCMAPS module for creating and passing introspect/run argument lists) . . . . .	52
<a href="#">lcmaps_arguments.h</a> (Public header file to be used by plugins) . . . . .	53
<a href="#">lcmaps_cred_data.c</a> (Routines to handle lcmaps credential data) . . . . .	56
<a href="#">lcmaps_cred_data.h</a> (Public header file to be used by plugins) . . . . .	58
<a href="#">lcmaps_db_read.c</a> (The LCMAPS database reader) . . . . .	60
<a href="#">lcmaps_db_read.h</a> (Header file for LCMAPS database structure) . . . . .	64
<a href="#">lcmaps_defines.h</a> (Public header file with common definitions for the LCMAPS (authorization modules)) . . . . .	65
<a href="#">lcmaps_dummy_bad.c</a> (Interface to the LCMAPS plugins) . . . . .	66
<a href="#">lcmaps_dummy_good.c</a> (Interface to the LCMAPS plugins) . . . . .	67
<a href="#">lcmaps_gss_assist_gridmap.c</a> (Legacy interface for LCMAPS) . . . . .	68
<a href="#">lcmaps_jobrep.c</a> (Plugin to get data for the Job Repository Database) . . . . .	69
<a href="#">lcmaps_ldap.c</a> (Interface to the LCMAPS plugins) . . . . .	72
<a href="#">lcmaps_localaccount.c</a> (Interface to the LCMAPS plugins) . . . . .	75
<a href="#">lcmaps_log.c</a> (Logging routines for LCMAPS) . . . . .	76
<a href="#">lcmaps_log.h</a> (Logging API for the LCMAPS plugins and LCMAPS itself) . . . . .	78
<a href="#">lcmaps_modules.h</a> (The LCMAPS authorization plugins/modules should "include" this file) . . . . .	80
<a href="#">lcmaps_plugin_example.c</a> (Interface to the LCMAPS plugins) . . . . .	81
<a href="#">lcmaps_pluginmanager.c</a> (The plugin manager for LCMAPS) . . . . .	82
<a href="#">lcmaps_poolaccount.c</a> (Interface to the LCMAPS plugins) . . . . .	86

---

<a href="#">lcmaps_posix.c</a> (Interface to the LCMAPS plugins) . . . . .	87
<a href="#">lcmaps_runvars.c</a> (Extract variables that will be used by the plugins) . . . . .	88
<a href="#">lcmaps_types.h</a> (Public header file with typedefs for LCMAPS) . . . . .	89
<a href="#">lcmaps_utils.c</a> (The utilities for the LCMAPS) . . . . .	90
<a href="#">lcmaps_utils.h</a> (API for the utilities for the LCMAPS) . . . . .	92
<a href="#">lcmaps_vo_data.c</a> (LCMAPS utilities for creating and accessing VO data structures) . . . . .	95
<a href="#">lcmaps_vo_data.h</a> (LCMAPS module for creating and accessing VO data structures) . . . . .	96
<a href="#">lcmaps_voms.c</a> (Interface to the LCMAPS plugins) . . . . .	102
<a href="#">lcmaps_voms_localaccount.c</a> (Interface to the LCMAPS plugins) . . . . .	103
<a href="#">lcmaps_voms_localgroup.c</a> (Interface to the LCMAPS plugins) . . . . .	104
<a href="#">lcmaps_voms_poolaccount.c</a> (Interface to the LCMAPS plugins) . . . . .	105
<a href="#">lcmaps_voms_poolgroup.c</a> (Interface to the LCMAPS plugins) . . . . .	106
<b>jobrepository/lcmaps_voms_utils.c</b> . . . . .	??
<b>voms/lcmaps_voms_utils.c</b> . . . . .	??
<b>jobrepository/lcmaps_voms_utils.h</b> . . . . .	??
<b>voms/lcmaps_voms_utils.h</b> . . . . .	??
<a href="#">pdl.h</a> (General include file) . . . . .	109
<a href="#">pdl_main.c</a> (All functions that do not fit elsewhere can be found here) . . . . .	114
<a href="#">pdl_policy.c</a> (Implementation of the pdl policies) . . . . .	121
<a href="#">pdl_policy.h</a> (Include file for using the pdl policies) . . . . .	125
<a href="#">pdl_rule.c</a> (Implementation of the pdl rules) . . . . .	126
<a href="#">pdl_rule.h</a> (Include file for using the pdl rules) . . . . .	133
<a href="#">pdl_variable.c</a> (Implementation of the pdl variables) . . . . .	135
<a href="#">pdl_variable.h</a> (Include file for using the pdl variables) . . . . .	139

---

## Chapter 5

# edg-lcmaps Page Index

### 5.1 edg-lcmaps Related Pages

Here is a list of all related documentation pages:

Job Repository plugin . . . . .	141
afs plugin . . . . .	143
dummy NOT OK plugin . . . . .	145
dummy OK plugin . . . . .	146
example plugin . . . . .	147
ldap enforcement plugin . . . . .	148
localaccount plugin . . . . .	150
poolaccount plugin . . . . .	152
posix enforcement plugin . . . . .	154
voms plugin . . . . .	156
voms local account plugin . . . . .	158
voms localgroup plugin . . . . .	160
voms poolaccount plugin . . . . .	162
voms poolgroup plugin . . . . .	165

---

## Chapter 6

# edg-lcmaps Module Documentation

### 6.1 Interface to LCMAPS (library)

The API is available by including the header [lcmaps.h](#).

#### Files

- file [lcmaps.h](#)  
*API of the LCMAPS library.*

#### 6.1.1 Detailed Description

The API is available by including the header [lcmaps.h](#).

---

## 6.2 The API to be used by the LCMAPS plugins

The API is available by including the header [lcmaps\\_modules.h](#).

### Files

- file [lcmaps\\_arguments.h](#)  
*Public header file to be used by plugins.*
- file [lcmaps\\_cred\\_data.h](#)  
*Public header file to be used by plugins.*
- file [lcmaps\\_defines.h](#)  
*Public header file with common definitions for the LCMAPS (authorization modules).*
- file [lcmaps\\_log.h](#)  
*Logging API for the LCMAPS plugins and LCMAPS itself.*
- file [lcmaps\\_modules.h](#)  
*The LCMAPS authorization plugins/modules should "include" this file.*
- file [lcmaps\\_types.h](#)  
*Public header file with typedefs for LCMAPS.*
- file [lcmaps\\_utils.h](#)  
*API for the utilities for the LCMAPS.*
- file [lcmaps\\_vo\\_data.h](#)  
*LCMAPS module for creating and accessing VO data structures.*

### 6.2.1 Detailed Description

The API is available by including the header [lcmaps\\_modules.h](#).

## 6.3 The interface to the LCMAPS plugins

Here the interface is shown that the plugin has to provide to the LCMAPS. The interface consists of the following functions:

1. `plugin_initialize()`
2. `plugin_run()`
3. `plugin_terminate()`
4. `plugin_introspect()`

---

## Chapter 7

# edg-lcmaps Data Structure Documentation

### 7.1 cred\_data\_s Struct Reference

structure that contains the gathered (local) credentials en VOMS info.

```
#include <lcmaps_cred_data.h>
```

#### Data Fields

- char \* [dn](#)
- uid\_t \* [uid](#)
- gid\_t \* [priGid](#)
- gid\_t \* [secGid](#)
- [lcmaps\\_vo\\_data\\_t](#) \* [VoCred](#)
- char \*\* [VoCredString](#)
- [lcmaps\\_vo\\_mapping\\_t](#) \* [VoCredMapping](#)
- int [cntUid](#)
- int [cntPriGid](#)
- int [cntSecGid](#)
- int [cntVoCred](#)
- int [cntVoCredString](#)
- int [cntVoCredMapping](#)

#### 7.1.1 Detailed Description

structure that contains the gathered (local) credentials en VOMS info.

Definition at line 56 of file `lcmaps_cred_data.h`.

#### 7.1.2 Field Documentation

##### 7.1.2.1 int cred\_data\_s::cntPriGid

number of primary groupIDs (in principle only one)

---

Definition at line 66 of file lcmapi\_cred\_data.h.

Referenced by printCredData.

#### **7.1.2.2 int cred\_data\_s::cntSecGid**

number of secondary groupIDs (could be any number)

Definition at line 67 of file lcmapi\_cred\_data.h.

Referenced by printCredData.

#### **7.1.2.3 int cred\_data\_s::cntUid**

number of userIDs

Definition at line 65 of file lcmapi\_cred\_data.h.

Referenced by printCredData.

#### **7.1.2.4 int cred\_data\_s::cntVoCred**

number of VO data structures

Definition at line 68 of file lcmapi\_cred\_data.h.

Referenced by printCredData.

#### **7.1.2.5 int cred\_data\_s::cntVoCredMapping**

number of VO mapping structures

Definition at line 70 of file lcmapi\_cred\_data.h.

Referenced by printCredData.

#### **7.1.2.6 int cred\_data\_s::cntVoCredString**

number of VO data strings

Definition at line 69 of file lcmapi\_cred\_data.h.

Referenced by printCredData.

#### **7.1.2.7 char\* cred\_data\_s::dn**

user globus DN

Definition at line 58 of file lcmapi\_cred\_data.h.

Referenced by printCredData.

#### **7.1.2.8 gid\_t\* cred\_data\_s::priGid**

list of primary groupIDs

Definition at line 60 of file lcms\_cred\_data.h.

Referenced by printCredData.

#### 7.1.2.9 gid\_t\* cred\_data\_s::secGid

list of secondary groupIDs

Definition at line 61 of file lcms\_cred\_data.h.

Referenced by printCredData.

#### 7.1.2.10 uid\_t\* cred\_data\_s::uid

list of userIDs

Definition at line 59 of file lcms\_cred\_data.h.

Referenced by printCredData.

#### 7.1.2.11 lcms\_vo\_data\_t\* cred\_data\_s::VoCred

list of VO data structures

Definition at line 62 of file lcms\_cred\_data.h.

Referenced by printCredData.

#### 7.1.2.12 lcms\_vo\_mapping\_t\* cred\_data\_s::VoCredMapping

list of VO mapping structures

Definition at line 64 of file lcms\_cred\_data.h.

Referenced by printCredData.

#### 7.1.2.13 char\*\* cred\_data\_s::VoCredString

list of VO data strings

Definition at line 63 of file lcms\_cred\_data.h.

Referenced by printCredData.

The documentation for this struct was generated from the following file:

- [lcmaps\\_cred\\_data.h](#)

## 7.2 `lcmaps_argument_s` Struct Reference

structure representing an LCMAPS plugin run argument.

```
#include <lcmaps_arguments.h>
```

### Data Fields

- `char * argName`
- `char * argType`
- `int argInOut`
- `void * value`

### 7.2.1 Detailed Description

structure representing an LCMAPS plugin run argument.

Definition at line 42 of file `lcmaps_arguments.h`.

### 7.2.2 Field Documentation

#### 7.2.2.1 `int lcmaps_argument_s::argInOut`

input or output argument (0 = false = Input / 1 = true = Out)

Definition at line 46 of file `lcmaps_arguments.h`.

#### 7.2.2.2 `char* lcmaps_argument_s::argName`

name of argument

Definition at line 44 of file `lcmaps_arguments.h`.

#### 7.2.2.3 `char* lcmaps_argument_s::argType`

type of the argument

Definition at line 45 of file `lcmaps_arguments.h`.

#### 7.2.2.4 `void* lcmaps_argument_s::value`

value of argument

Definition at line 47 of file `lcmaps_arguments.h`.

The documentation for this struct was generated from the following file:

- [lcmaps\\_arguments.h](#)

## 7.3 `lcmaps_cred_id_s` Struct Reference

structure representing an LCMAPS credential.

```
#include <lcmaps_types.h>
```

### Data Fields

- `gss_cred_id_t cred`
- `char * dn`

### 7.3.1 Detailed Description

structure representing an LCMAPS credential.

Definition at line 47 of file `lcmaps_types.h`.

### 7.3.2 Field Documentation

#### 7.3.2.1 `gss_cred_id_t lcmaps_cred_id_s::cred`

the original gss (globus) credential

Definition at line 49 of file `lcmaps_types.h`.

#### 7.3.2.2 `char* lcmaps_cred_id_s::dn`

the user distinguished name (DN)

Definition at line 50 of file `lcmaps_types.h`.

The documentation for this struct was generated from the following file:

- [lcmaps\\_types.h](#)

## 7.4 lcmaps\_db\_entry\_s Struct Reference

LCMAPS data base element structure.

```
#include <lcmaps_db_read.h>
```

### Data Fields

- char [pluginname](#) [LCMAPS\_MAXPATHLEN+1]
- char [pluginargs](#) [LCMAPS\_MAXARGSTRING+1]
- lcmaps\_db\_entry\_s \* [next](#)

### 7.4.1 Detailed Description

LCMAPS data base element structure.

Definition at line 42 of file lcmaps\_db\_read.h.

### 7.4.2 Field Documentation

#### 7.4.2.1 struct lcmaps\_db\_entry\_s\* lcmaps\_db\_entry\_s::next

handle to next db element

Definition at line 46 of file lcmaps\_db\_read.h.

Referenced by `free_lcmaps_db_entry`, and `getPluginNameAndArgs`.

#### 7.4.2.2 char lcmaps\_db\_entry\_s::pluginargs[LCMAPS\_MAXARGSTRING+1]

Argument list to be passed to authorization plugin/module

Definition at line 45 of file lcmaps\_db\_read.h.

Referenced by `getPluginNameAndArgs`, `lcmaps_db_parse_line`, `lcmaps_db_read_entries`, and `PluginInit`.

#### 7.4.2.3 char lcmaps\_db\_entry\_s::pluginname[LCMAPS\_MAXPATHLEN+1]

Name of authorization plugin/module

Definition at line 44 of file lcmaps\_db\_read.h.

Referenced by `getPluginNameAndArgs`, `lcmaps_db_parse_line`, `lcmaps_db_read_entries`, and `PluginInit`.

The documentation for this struct was generated from the following file:

- [lcmaps\\_db\\_read.h](#)

## 7.5 lcms\_plugin\_t Struct Reference

the lcms plugin module structure.

### Data Fields

- void \* [handle](#)
- [lcmaps\\_proc\\_t](#) [procs](#) [MAXPROCS]
- char [pluginname](#) [LCMAPS\_MAXPATHLEN+1]
- char [pluginargs](#) [LCMAPS\_MAXARGSTRING+1]
- int [init\\_argc](#)
- char \* [init\\_argv](#) [LCMAPS\_MAXARGS]
- int [run\\_argc](#)
- [lcmaps\\_argument\\_t](#) \* [run\\_argv](#)
- [lcmaps\\_plugin\\_t](#) \* [next](#)

### 7.5.1 Detailed Description

the lcms plugin module structure.

Definition at line 103 of file `lcmaps_pluginmanager.c`.

### 7.5.2 Field Documentation

#### 7.5.2.1 void\* lcms\_plugin\_t::handle

dlopen handle to plugin module

Definition at line 105 of file `lcmaps_pluginmanager.c`.

Referenced by `clean_plugin_list`, `PluginInit`, and `print_lcms_plugin`.

#### 7.5.2.2 int lcms\_plugin\_t::init\_argc

number of arguments for the initialization function

Definition at line 109 of file `lcmaps_pluginmanager.c`.

Referenced by `clean_plugin_list`, `PluginInit`, and `print_lcms_plugin`.

#### 7.5.2.3 char\* lcms\_plugin\_t::init\_argv[LCMAPS\_MAXARGS]

list of arguments for the initialization function

Definition at line 110 of file `lcmaps_pluginmanager.c`.

Referenced by `clean_plugin_list`, `PluginInit`, and `print_lcms_plugin`.

**7.5.2.4 struct lcmads\_pluginidl\_s\* lcmads\_pluginidl\_s::next**

pointer to the next plugin in the plugin list

Definition at line 113 of file lcmads\_pluginmanager.c.

Referenced by clean\_plugin\_list, PluginInit, and print\_lcmads\_plugin.

**7.5.2.5 char lcmads\_pluginidl\_s::pluginargs[LCMAPS\_MAXARGSTRING+1]**

argument string

Definition at line 108 of file lcmads\_pluginmanager.c.

Referenced by PluginInit, and print\_lcmads\_plugin.

**7.5.2.6 char lcmads\_pluginidl\_s::pluginname[LCMAPS\_MAXPATHLEN+1]**

name of plugin

Definition at line 107 of file lcmads\_pluginmanager.c.

Referenced by clean\_plugin\_list, PluginInit, and print\_lcmads\_plugin.

**7.5.2.7 lcmads\_proc\_t lcmads\_pluginidl\_s::procs[MAXPROCS]**

list of handles to interface functions of plugin

Definition at line 106 of file lcmads\_pluginmanager.c.

Referenced by clean\_plugin\_list, PluginInit, and print\_lcmads\_plugin.

**7.5.2.8 int lcmads\_pluginidl\_s::run\_argc**

number of arguments for the plugin run function (get credentials)

Definition at line 111 of file lcmads\_pluginmanager.c.

Referenced by PluginInit, and print\_lcmads\_plugin.

**7.5.2.9 lcmads\_argument\_t\* lcmads\_pluginidl\_s::run\_argv**

list of arguments for the plugin run function (get credentials)

Definition at line 112 of file lcmads\_pluginmanager.c.

Referenced by PluginInit, and print\_lcmads\_plugin.

The documentation for this struct was generated from the following file:

- [lcmads\\_pluginmanager.c](#)

## 7.6 lcmsaps\_vo\_data\_s Struct Reference

structure that contains the VO information found in the user's gss credential.

```
#include <lcmaps_vo_data.h>
```

### Data Fields

- char \* [vo](#)
- char \* [group](#)
- char \* [subgroup](#)
- char \* [role](#)
- char \* [capability](#)

### 7.6.1 Detailed Description

structure that contains the VO information found in the user's gss credential.

Definition at line 57 of file lcmsaps\_vo\_data.h.

### 7.6.2 Field Documentation

#### 7.6.2.1 char\* lcmsaps\_vo\_data\_s::capability

the user's capability

Definition at line 63 of file lcmsaps\_vo\_data.h.

#### 7.6.2.2 char\* lcmsaps\_vo\_data\_s::group

group within the VO

Definition at line 60 of file lcmsaps\_vo\_data.h.

#### 7.6.2.3 char\* lcmsaps\_vo\_data\_s::role

the user's role

Definition at line 62 of file lcmsaps\_vo\_data.h.

#### 7.6.2.4 char\* lcmsaps\_vo\_data\_s::subgroup

subgroup name

Definition at line 61 of file lcmsaps\_vo\_data.h.

#### 7.6.2.5 char\* lcmsaps\_vo\_data\_s::vo

name of the VO to which the user belongs

Definition at line 59 of file lcmsaps\_vo\_data.h.

The documentation for this struct was generated from the following file:

- [lcmaps\\_vo\\_data.h](#)

## 7.7 lcmaps\_vo\_mapping\_s Struct Reference

structure that contains the VO information string (or FQAN) and the local Gid it is mapped to.

```
#include <lcmaps_vo_data.h>
```

### Data Fields

- char \* [vostring](#)
- char \* [groupname](#)
- gid\_t [gid](#)

#### 7.7.1 Detailed Description

structure that contains the VO information string (or FQAN) and the local Gid it is mapped to.

Definition at line 75 of file lcmaps\_vo\_data.h.

#### 7.7.2 Field Documentation

##### 7.7.2.1 gid\_t lcmaps\_vo\_mapping\_s::gid

GID the VO information string should be mapped to (according to the groupmapfile)

Definition at line 80 of file lcmaps\_vo\_data.h.

##### 7.7.2.2 char\* lcmaps\_vo\_mapping\_s::groupname

groupname the VO information string should be mapped to (according to the groupmapfile)

Definition at line 78 of file lcmaps\_vo\_data.h.

##### 7.7.2.3 char\* lcmaps\_vo\_mapping\_s::vostring

VO information string

Definition at line 77 of file lcmaps\_vo\_data.h.

The documentation for this struct was generated from the following file:

- [lcmaps\\_vo\\_data.h](#)

## 7.8 plugin\_s Struct Reference

Structure holds a plugin name and its arguments, as well as the line number the plugin is first mentioned.

```
#include <pdl.h>
```

### Data Fields

- char \* [name](#)  
*Plugin name.*
- char \* [args](#)  
*Arguments of the plugin.*
- unsigned int [lineno](#)  
*Line number where the plugin is first seen in the configuration file.*
- plugin\_s \* [next](#)  
*Next plugin, or 0 if there are no-more plugins.*

### 7.8.1 Detailed Description

Structure holds a plugin name and its arguments, as well as the line number the plugin is first mentioned.

Definition at line 94 of file [pdl.h](#).

The documentation for this struct was generated from the following file:

- [pdl.h](#)

## 7.9 `policy_s` Struct Reference

Keeping track of found policies.

```
#include <pdl_policy.h>
```

### Data Fields

- `const char * name`  
*Name of the policy.*
- `rule_t * rule`  
*Pointer to the first rule of the policy.*
- `unsigned int lineno`  
*Line number where the polict was found.*
- `policy_s * next`  
*Next policy, or 0 if none.*
- `policy_s * prev`  
*Previous policy, or 0 if none.*

### 7.9.1 Detailed Description

Keeping track of found policies.

Definition at line 41 of file `pdl_policy.h`.

The documentation for this struct was generated from the following file:

- `pdl_policy.h`

## 7.10 record\_s Struct Reference

Structure is used to keep track of strings and the line they appear on.

```
#include <pdl.h>
```

### Data Fields

- char \* [string](#)  
*Hold the symbol that lex has found.*
- int [lineno](#)  
*Hold the line number the symbol has been found.*

### 7.10.1 Detailed Description

Structure is used to keep track of strings and the line they appear on.

When lex finds a match, this structure is used to keep track of the relevant information. The matching string as well as the line number are saved. The line number can be used for later references when an error related to the symbol has occurred. This allows for easier debugging of the configuration file.

Definition at line 83 of file [pdl.h](#).

The documentation for this struct was generated from the following file:

- [pdl.h](#)

## 7.11 rule\_s Struct Reference

Structure keeps track of the state and the true/false braches.

```
#include <pdl_rule.h>
```

### Data Fields

- const char \* [state](#)  
*Name of the state.*
- const char \* [true\\_branch](#)  
*Name of the true\_branch, or 0 if none.*
- const char \* [false\\_branch](#)  
*Name of the false\_branch, or 0 if none.*
- unsigned int [lineno](#)  
*Line number where rule appeared.*
- rule\_s \* [next](#)  
*Next rule, or 0 if none.*

### 7.11.1 Detailed Description

Structure keeps track of the state and the true/false braches.

Definition at line 40 of file pdl\_rule.h.

The documentation for this struct was generated from the following file:

- [pdl\\_rule.h](#)

## 7.12 var\_s Struct Reference

Structure keeps track of the variables, their value and the line number they are defined on.

```
#include <pdl_variable.h>
```

### Data Fields

- const char \* [name](#)  
*Name of the variable.*
- const char \* [value](#)  
*Value of the variable.*
- BOOL [okay](#)  
*TRUE if substitution can be done without further checking.*
- unsigned int [lineno](#)  
*Line number the variable appears on.*
- var\_s \* [next](#)  
*Next variable, or 0 if none.*

### 7.12.1 Detailed Description

Structure keeps track of the variables, their value and the line number they are defined on.

Definition at line 44 of file `pdl_variable.h`.

The documentation for this struct was generated from the following file:

- [pdl\\_variable.h](#)

---

## Chapter 8

# edg-lcmaps File Documentation

### 8.1 `_lcmaps_cred_data.h` File Reference

Internal header file of LCMAPS credential data.

```
#include "lcmaps_cred_data.h"
```

#### Functions

- int [cleanCredentialData](#) ()  
*Clean the credData structure.*

#### 8.1.1 Detailed Description

Internal header file of LCMAPS credential data.

**Author:**

Oscar Koeroo and Martijn Steenbakkens for the EU DataGrid.

Definition in file [\\_lcmaps\\_cred\\_data.h](#).

#### 8.1.2 Function Documentation

##### 8.1.2.1 `cleanCredentialData` ()

Clean the credData structure.

**Returns:**

0

Definition at line 265 of file `lcmaps_cred_data.c`.

---

## 8.2 lcmaps\_db\_read.h File Reference

Internal header file of LCMAPS database reader.

```
#include "lcmaps_db_read.h"
```

### Functions

- [lcmaps\\_db\\_entry\\_t](#) \* [lcmaps\\_db\\_fill\\_entry](#) ([lcmaps\\_db\\_entry\\_t](#) \*\*plcmaps\_db, [lcmaps\\_db\\_entry\\_t](#) \*db\_entry)  
*Add a database entry to a list.*
- [lcmaps\\_db\\_entry\\_t](#) \*\* [lcmaps\\_db\\_read](#) (char \*lcmaps\_db\_fname)  
*Read database from file.*
- int [lcmaps\\_db\\_clean\\_list](#) ([lcmaps\\_db\\_entry\\_t](#) \*\*list)  
*Clean/remove the database list.*
- int [lcmaps\\_db\\_clean](#) ()  
*Clean/remove the database structure.*

### 8.2.1 Detailed Description

Internal header file of LCMAPS database reader.

#### Author:

Martijn Steenbakkens for the EU DataGrid.

This header contains the declarations of the LCMAPS database reader functions and typedefs.

Definition in file [\\_lcmaps\\_db\\_read.h](#).

### 8.2.2 Function Documentation

#### 8.2.2.1 [lcmaps\\_db\\_clean](#) ()

Clean/remove the database structure.

#### Return values:

- 0 succes
- 1 failure

Definition at line 585 of file [lcmaps\\_db\\_read.c](#).

#### 8.2.2.2 [lcmaps\\_db\\_clean\\_list](#) ([lcmaps\\_db\\_entry\\_t](#) \*\* list)

Clean/remove the database list.

**Parameters:**

*list* pointer to the database list

**Return values:**

*0* succes.

*1* failure.

Definition at line 555 of file `lcmaps_db_read.c`.

**8.2.2.3 `lcmaps_db_fill_entry` (`lcmaps_db_entry_t` \*\* *list*, `lcmaps_db_entry_t` \* *entry*)**

Add a database entry to a list.

**Parameters:**

*list* database list (array of database entry pointers)

*entry* the database entry to be added

**Returns:**

a pointer to the newly created database entry in the list or NULL (error)

Definition at line 198 of file `lcmaps_db_read.c`.

Referenced by `lcmaps_db_read_entries`.

**8.2.2.4 `lcmaps_db_read` (`char` \* *lcmaps\_db*)**

Read database from file.

**Parameters:**

*lcmaps\_db\_fname* database file.

**Returns:**

a pointer to the database list

Definition at line 89 of file `lcmaps_db_read.c`.

## 8.3 `lcmaph_log.h` File Reference

Internal header file for LCMAPS logging routines.

```
#include "lcmaph_log.h"
```

### Functions

- `syslogging` has to be done internal `*int lcmaph_log_open` (`char *path`, `FILE *fp`, unsigned short `logtype`)  
*Start logging.*
- `int lcmaph_log_close` ()  
*Stop logging.*

### 8.3.1 Detailed Description

Internal header file for LCMAPS logging routines.

#### Author:

Martijn Steenbakkens for the EU DataGrid.

Definition in file `lcmaph_log.h`.

### 8.3.2 Function Documentation

#### 8.3.2.1 `lcmaph_log_close` ()

Stop logging.

Definition at line 324 of file `lcmaph_log.c`.

#### 8.3.2.2 `lcmaph_log_open` (`char *path`, `FILE *fp`, unsigned short `logtype`)

Start logging.

This function should only be used by the LCMAPS itself. It opens the logfile and tries to set the debugging level in the following order:

1. Try if `DEBUG_LEVEL > 0`
2. Try if environment variable `LCMAPS_DEBUG_LEVEL` is set and if it is an integer `> 0`
3. Otherwise set `debug_level = 0`;

#### Parameters:

*path* path of logfile.

*fp* file pointer to already opened file (or NULL)

*logtype* `DO_USRLOG`, `DO_SYSLOG`

**Return values:**

*0* succes.

*1* failure.

Definition at line 82 of file `lcmaps_log.c`.

## 8.4 \_lcmapi\_pluginmanager.h File Reference

API of the PluginManager.

```
#include <gssapi.h>
#include "lcmapi_types.h"
```

### Functions

- int [startPluginManager](#) ()  
*start the PluginManager.*
- int [stopPluginManager](#) ()  
*Terminate the PluginManager module.*
- int [runPluginManager](#) ([lcmapi\\_request\\_t](#) request, [lcmapi\\_cred\\_id\\_t](#) lcmapi\_cred, int npols, char \*\*policynames)  
*Run the PluginManager.*
- int [runPlugin](#) (const char \*pluginname)  
*Run a plugin.*
- int [resetCredentialData](#) ()  
*Reset the Credential data.*

### 8.4.1 Detailed Description

API of the PluginManager.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This header contains the declarations of the LCMAPS library functions:

1. [startPluginManager](#)(): start the PluginManager → load plugins, start evaluation manager
2. [runPluginManager](#)(): run the PluginManager → run evaluation manager → run plugins
3. [stopPluginManager](#)(): stop the PluginManager
4. [runPlugin](#)(): run the specified plugin. (used by Evaluation Manager)
5. [resetCredentialData](#)(): reset the Credential Data. (used by Evaluation Manager)

Definition in file [\\_lcmapi\\_pluginmanager.h](#).

## 8.4.2 Function Documentation

### 8.4.2.1 resetCredentialData ()

Reset the Credential data.

Wrapper around [cleanCredentialData\(\)](#) to be used by the Evaluation Manager, before a new policy is evaluated

**Returns:**

the return value of [cleanCredentialData\(\)](#)

Definition at line 976 of file lcmaps\_pluginmanager.c.

Referenced by `pdl_next_plugin`.

### 8.4.2.2 runPlugin (const char \* *pluginname*)

Run a plugin.

Run a plugin for the Evaluation Manager the result (succes or not will be passed to the Evaluation Manager)

**Parameters:**

*pluginname* the name of the plugin module

**Return values:**

*0* plugin run succeeded

*1* plugin run failed

Definition at line 1008 of file lcmaps\_pluginmanager.c.

### 8.4.2.3 runPluginManager ([lcmaps\\_request\\_t](#) *request*, [lcmaps\\_cred\\_id\\_t](#) *lcmaps\_cred*, int *npols*, char \*\* *policynames*)

Run the PluginManager.

This function runs the PluginManager for user mapping. Contact Evaluation Manager -> runs plugins

**Parameters:**

*request* RSL request (job request)

*lcmaps\_cred* user credential

*npols* number of policies to be considered for evaluation

*policynames* the names of the policies to be considered for evaluation

**Return values:**

*0* user mapping succeeded

*1* user mapping failed

Definition at line 856 of file lcmaps\_pluginmanager.c.

#### 8.4.2.4 startPluginManager ()

start the PluginManager.

start the PluginManager -> load plugins, start evaluation manager

**Return values:**

*0* succes

*1* failure

Definition at line 155 of file lcmapi\_pluginmanager.c.

#### 8.4.2.5 stopPluginManager ()

Terminate the PluginManager module.

stop the PluginManager -> terminate plugins, clean plugin list, (stop evaluation manager)

**Return values:**

*0* succes

*1* failure

Definition at line 1064 of file lcmapi\_pluginmanager.c.

## 8.5 `lcmapi_runvars.h` File Reference

API of runvars structure.

```
#include "lcmapi_types.h"
```

### Functions

- `int lcmapi_extractRunVars (lcmapi_request_t request, lcmapi_cred_id_t lcmapi_cred)`  
*extract the variables from user credential that can be used by the plugins.*
- `void * lcmapi_getRunVars (char *argName, char *argType)`  
*returns a void pointer to the requested value.*
- `int lcmapi_setRunVars (char *argName, char *argType, void *value)`  
*fill the runvars\_list with a value for argName and argType.*

### 8.5.1 Detailed Description

API of runvars structure.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This module takes the data that are presented to LCMAPS (the global credential and Job request) and extracts the variables that will be used by the plugins from it and stores them into a list. The interface to the LCMAPS module is composed of:

1. `lcmapi_extractRunVars()`: takes the global credential and Job request and extracts run variables from them
2. `lcmapi_setRunVars()`: adds run variables to a list
3. `lcmapi_getRunVars()`: gets run variables from list

Definition in file `lcmapi_runvars.h`.

### 8.5.2 Function Documentation

#### 8.5.2.1 `lcmapi_extractRunVars (lcmapi_request_t request, lcmapi_cred_id_t lcmapi_cred)`

extract the variables from user credential that can be used by the plugins.

This function takes the user credential and job request (in RSL) and extracts the information which is published in the runvars\_list. These variables can be accessed by the plugins.

**Parameters:**

*request* the job request (RSL)

*lcmapi\_cred* the credential presented by the user

**Return values:**

- 0* succes.
- 1* failure.

Definition at line 97 of file lcmapi\_runvars.c.

**8.5.2.2 lcmapi\_getRunVars (char \* *argName*, char \* *argType*)**

returns a void pointer to the requested value.

This function returns a void pointer to the requested variable with name *argName* and type *argType* in the *runvars\_list*. Internally it uses [lcmapi\\_getArgValue\(\)](#).

**Parameters:**

- argName* name of the variable
- argType* type of the variable

**Returns:**

- void pointer to the value or NULL

Definition at line 192 of file lcmapi\_runvars.c.

**8.5.2.3 lcmapi\_setRunVars (char \* *argName*, char \* *argType*, void \* *value*)**

fill the *runvars\_list* with a value for *argName* and *argType*.

This function fills the (internal) *runvars\_list* with the value for the variable with name *argName* and type *argType*. Internally [lcmapi\\_setArgValue\(\)](#) is used.

**Parameters:**

- argName* name of the runvars variable
- argType* type of the runvars variable
- values* void pointer to the value

**Return values:**

- 0* succes.
- 1* failure.

Definition at line 233 of file lcmapi\_runvars.c.

## 8.6 `lcmapi_utils.h` File Reference

Internal header for the LCMAPS utilities.

```
#include <gssapi.h>
#include "lcmapi_types.h"
#include "lcmapi_utils.h"
```

### CREDENTIAL FUNCTIONS

- `int lcmapi_fill_cred` (`char *dn`, `gss_cred_id_t cred`, `lcmapi_cred_id_t *lcmapi_credential`)  
*Fill credential from distinguished name and globus credential.*
- `int lcmapi_release_cred` (`lcmapi_cred_id_t *lcmapi_credential`)  
*Release the LCMAPS credential.*

### OTHER FUNCTIONS

- `int lcmapi_tokenize` (`const char *command`, `char **args`, `int *n`, `char *sep`)  
*Break the argument string up into tokens.*

#### 8.6.1 Detailed Description

Internal header for the LCMAPS utilities.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This header contains the declarations of the LCMAPS utility functions:

1. `lcmapi_fill_cred()`:
2. `lcmapi_release_cred()`:
3. `lcmapi_tokenize()`:

Definition in file `lcmapi_utils.h`.

#### 8.6.2 Function Documentation

##### 8.6.2.1 `lcmapi_fill_cred` (`char *dn`, `gss_cred_id_t cred`, `lcmapi_cred_id_t *lcmapi_credential`)

Fill credential from distinguished name and globus credential.

The LCMAPS credential only differs from the GLOBUS credential by the extra entry for the dn. This allows (temporarily) the passed delegated GLOBUS credential to be empty.

**Parameters:**

*dn* distinguished name

*cred* GLOBUS credential

*lcmaps\_cred* pointer to LCMAPS credential to be filled.

**Return values:**

*0* succes.

*1* failure.

Definition at line 74 of file lcmaps\_utils.c.

### 8.6.2.2 `lcmaps_release_cred (lcmaps_cred_id_t *lcmaps_credential)`

Release the LCMAPS credential.

**Parameters:**

*lcmaps\_cred* pointer to LCMAPS credential to be released

**Return values:**

*0* succes.

*1* failure.

Definition at line 117 of file lcmaps\_utils.c.

### 8.6.2.3 `lcmaps_tokenize (const char *command, char **args, int *n, char *sep)`

Break the argument string up into tokens.

Breakup the command in to arguments, pointing the args array at the tokens. Replace white space at the end of each token with a null. A token maybe in quotes. (Copied (and modified) from GLOBUS gatekeeper.c)

**Parameters:**

*command* the command line to be parsed

*args* pointer to an array of pointers to be filled

*n* size of the array, on input, and set to size used on output

*sep* string of separating characters

**Return values:**

*0* succes

*-1* malloc error

*-2* too many args

*-3* quote not matched

Definition at line 464 of file lcmaps\_utils.c.

## 8.7 evaluationmanager.c File Reference

Implementation of the evaluation manager interface.

```
#include <stdlib.h>
#include <string.h>
#include "_lcmaps_pluginmanager.h"
#include "lcmaps_log.h"
#include "evaluationmanager.h"
```

### Functions

- int [free\\_lcmaps\\_db\\_entry](#) ()
- int [startEvaluationManager](#) (const char \*name)
- int [getPluginNameAndArgs](#) (lcmaps\_db\_entry\_t \*\*plugins)
- int [runEvaluationManager](#) (int argc, char \*argv[ ])
- int [stopEvaluationManager](#) (void)

### Variables

- [lcmaps\\_db\\_entry\\_t](#) \* [global\\_plugin\\_list](#) = NULL

#### 8.7.1 Detailed Description

Implementation of the evaluation manager interface.

Besides the implementation of the interface of the evaluation manager some additional functions are implemented here. Please note that these are **not** part of the interface and hence should not be used. Look in [evaluationmanager.h](#) for the functions that can be called by external sources.

**Author:**

G.M. Venekamp ([venekamp@nikhef.nl](mailto:venekamp@nikhef.nl))

Definition in file [evaluationmanager.c](#).

## 8.7.2 Function Documentation

### 8.7.2.1 `int free_lcmapi_db_entry ()`

During the `getPluginsAndArgs()` call, a list structure is created. This structure is never cleaned automatically, nor can it be. When it is necessary and safe to free the resources, call this function

**Return values:**

- `0` when the call is successful,
- `1` otherwise.

Definition at line 319 of file `evaluationmanager.c`.

References `lcmapi_db_entry_s::next`.

Referenced by `stopEvaluationManager`.

### 8.7.2.2 `int getPluginNameAndArgs (lcmapi_db_entry_t ** plugins)`

Get a list of plugins and their arguments based on the configuration file. The memory that is allocated is freed during the `stopEvaluationManager()` call.

**Parameters:**

- plugins* Pointer to be initialized with the first entry of the plugin list.

**Return values:**

- `0` when the call is successful,
- `1` otherwise.

Definition at line 110 of file `evaluationmanager.c`.

References `plugin_s::args`, `get_plugins`, `getPluginNameAndArgs`, `plugin_s::name`, `plugin_s::next`, `lcmapi_db_entry_s::next`, `pdl_path`, `lcmapi_db_entry_s::pluginargs`, `lcmapi_db_entry_s::pluginname`, and `TRUE`.

Referenced by `getPluginNameAndArgs`.

### 8.7.2.3 `int runEvaluationManager (int argc, char * argv[ ])`

Run the evaluation manager. The evaluation manager has to be initialized by calling `statrEvaluation Manager` first.

**Return values:**

- `0` when the call is successful,
- `1` otherwise.

Definition at line 205 of file `evaluationmanager.c`.

References `EVALUATION_FAILURE`, `EVALUATION_START`, `EVALUATION_SUCCESS`, `get_current_policy`, `policy_s::name`, `pdl_next_plugin`, `plugin_status_t`, and `runEvaluationManager`.

Referenced by `runEvaluationManager`.

#### 8.7.2.4 int startEvaluationManager (const char \* *name*)

Start the evaluation manager.

**Parameters:**

*name* Name of the configure script.

**Return values:**

*0* when the call is successful,

*1* otherwise.

Definition at line 63 of file evaluationmanager.c.

References `check_policies_for_recursion`, `pdl_init`, `reduce_policies`, `startEvaluationManager`, `stopEvaluationManager`, and `yyparse_errors`.

Referenced by `startEvaluationManager`.

#### 8.7.2.5 int stopEvaluationManager (void)

Stop the evaluation manager after it has run successfully. Strictly speaking, the evaluation manager needs no stopping. This call is a good point to clean up the resources used by the evaluation manager.

**Return values:**

*0* when the call is successful,

*1* otherwise.

Definition at line 298 of file evaluationmanager.c.

References `free_lcmaps_db_entry`, and `free_resources`.

Referenced by `startEvaluationManager`.

### 8.7.3 Variable Documentation

#### 8.7.3.1 `lcmaps_db_entry_t* global_plugin_list = NULL` [static]

When the `getPluginNameAndArgs()` function has been called, the `global_plugin_list` variable gets initialized with the first element of the list. This variable is later used to free the resources held by the list. In addition, multiple calls to `getPluginNameAndArgs()` result in returning the value of this pointer.

Definition at line 50 of file evaluationmanager.c.

## 8.8 evaluationmanager.h File Reference

Evaluation Manager interface definition.

```
#include "lcm maps_db_read.h"
#include "pdl.h"
#include "pdl_policy.h"
```

### 8.8.1 Detailed Description

Evaluation Manager interface definition.

The function listed in here are accessible to anyone. This is the way to communicate with the evaluation manager. The evaluation manager delegates the necessary work to the Policy Language Description module (PDL).

#include "lcmaps_types.h"
#include "lcmaps_utils.h"
#include "pluginmanager/_lcmaps_utils.h"
#include "lcmaps_cred_data.h"
```

### 8.9.1 Detailed Description

the LCMAPS module - the local credential mapping service.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

The interface to the LCMAPS module is composed of:

1. [lcmaps\\_init\(\)](#): start the PluginManager -> load plugins, start evaluation manager
2. [lcmaps\\_run\(\)](#): run the PluginManager -> run evaluation manager -> run plugins
3. [lcmaps\\_term\(\)](#): stop the PluginManager

Definition in file [lcmaps.c](#).

## 8.10 lcmapi.h File Reference

API of the LCMAPS library.

```
#include <gssapi.h>
#include "lcmapi_types.h"
```

### Functions

- `int lcmapi_init (FILE *fp)`  
*Initialize the LCMAPS module.*
- `int lcmapi_init_and_log (FILE *fp, unsigned short logtype)`  
*Initialize the LCMAPS module.*
- `int lcmapi_term ()`  
*Terminate the LCMAPS module.*
- `int lcmapi_run (gss_cred_id_t user_cred, lcmapi_request_t request)`  
*let LCMAPS handle the user mapping.*
- `int lcmapi_run_and_return_username (gss_cred_id_t user_cred, lcmapi_request_t request, char **usernamep, int npols, char **policynames)`  
*let LCMAPS handle the user mapping and return user name.*
- `int lcmapi_run_without_credentials (char *user_dn_tmp)`  
*do the user mapping without credentials, only the user DN.*

### 8.10.1 Detailed Description

API of the LCMAPS library.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This header contains the declarations of the LCMAPS library functions:

1. `lcmapi_init()`: To initialize the LCMAPS module
2. `lcmapi_run()`: To do the user mapping
3. `lcmapi_run_without_credentials()`: To do the user mapping, without credentials
4. `lcmapi_term()`: To cleanly terminate the module

Definition in file `lcmapi.h`.

## 8.10.2 Function Documentation

### 8.10.2.1 lcms\_init (FILE \*fp)

Initialize the LCMAPS module.

The function does the following:

- initialize LCMAPS module.
- setup logging, error handling (not yet).
- start PluginManager

**Parameters:**

*fp* file handle for logging (from gatekeeper or other previously opened file handle) If the file handle is zero, assume that only syslogging is requested

**Return values:**

- 0* initialization succeeded.
- 1* initialization failed.

Definition at line 180 of file lcms.c.

### 8.10.2.2 lcms\_init\_and\_log (FILE \*fp, unsigned short logtype)

Initialize the LCMAPS module.

The function does the following:

- initialize LCMAPS module.
- setup logging, error handling (not yet).
- start PluginManager

**Parameters:**

*fp* file handle for logging (from gatekeeper or other previously opened file handle) If the file handle is zero, assume that only syslogging is requested

*logtype* type of logging (usrlog and/or syslog)

**Return values:**

- 0* initialization succeeded.
- 1* initialization failed.

Definition at line 115 of file lcms.c.

References lcms\_request\_t.

### 8.10.2.3 lcms\_run (gss\_cred\_id\_t user\_cred, lcms\_request\_t request)

let LCMAPS handle the user mapping.

This function runs the PluginManager for user mapping.

**Parameters:**

*request* authorization request in RSL (later JDL)

*user\_cred* GLOBUS user credential

**Return values:**

*0* mapping succeeded.

*1* mapping failed.

Definition at line 231 of file lcmaps.c.

**8.10.2.4 `lcmaps_run_and_return_username` (`gss_cred_id_t user_cred`, `lcmaps_request_t request`, `char ** usernamep`, `int npols`, `char ** policynames`)**

let LCMAPS handle the user mapping and return user name.

do the user mapping based on the provided list of policies (first successful policy found in the lcmaps policy file (lcmaps.db) will result in the user mapping) and return user name (needed for e.g. GridFTP)

**Parameters:**

*request* authorization request in RSL (later JDL)

*user\_cred* GLOBUS user credential

*usernamep* pointer to user name (to be freed by calling application). Note: usernamep should be non-NULL at the start !

*npols* number of policies to be considered for evaluation

*policynames* the names of the policies to be considered for evaluation

**Return values:**

*0* mapping succeeded.

*1* mapping failed.

Definition at line 331 of file lcmaps.c.

**8.10.2.5 `lcmaps_run_without_credentials` (`char * user_dn_tmp`)**

do the user mapping without credentials, only the user DN.

This function runs the PluginManager for user mapping without credentials.

**Parameters:**

*user\_dn\_tmp* user DN

**Return values:**

*0* mapping succeeded.

*1* mapping failed.

Definition at line 442 of file lcmaps.c.

**8.10.2.6 `lcmaps_term` ()**

Terminate the LCMAPS module.

The function does the following:

- terminate the LCMAPS module
- terminate the plugins

**Return values:**

- 0* termination succeeded.
- 1* termination failed.

Definition at line 512 of file lcms.c.

## 8.11 `lcmaps_arguments.c` File Reference

LCMAPS module for creating and passing introspect/run argument lists.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include "lcmaps_arguments.h"
```

### 8.11.1 Detailed Description

LCMAPS module for creating and passing introspect/run argument lists.

**Author:**

Oscar Koeroo and Martijn Steenbakkens for the EU DataGrid.

The interface is composed of:

1. [lcmaps\\_setArgValue\(\)](#): Set the value of argument with name `argName` of `argType` to value
2. [lcmaps\\_getArgValue\(\)](#): Get the value of argument with name `argName` of `argType`
3. [lcmaps\\_findArgName\(\)](#): Get index of argument with name `argName`
4. [lcmaps\\_cntArgs\(\)](#): Count the number of arguments

Definition in file [lcmaps\\_arguments.c](#).

## 8.12 lcms\_args.h File Reference

Public header file to be used by plugins.

### Data Structures

- struct [lcmaps\\_argument\\_s](#)  
*structure representing an LCMAPS plugin run argument.*

### Typedefs

- typedef [lcmaps\\_argument\\_s](#) [lcmaps\\_argument\\_t](#)  
*Type of LCMAPS plugin run argument (to be passed to the plugin by [plugin\\_run\(\)](#)).*

### Functions

- int [lcmaps\\_setArgValue](#) (char \*argName, char \*argType, void \*value, int argcx, [lcmaps\\_argument\\_t](#) \*\*argvx)  
*Set the value of argument with name argName of argType to value.*
- void \* [lcmaps\\_getArgValue](#) (char \*argName, char \*argType, int argcx, [lcmaps\\_argument\\_t](#) \*argvx)  
*Get the value of argument with name argName of argType.*
- int [lcmaps\\_findArgName](#) (char \*argName, int argcx, [lcmaps\\_argument\\_t](#) \*argvx)  
*Get index of argument with name argName.*
- int [lcmaps\\_findArgNameAndType](#) (char \*argName, char \*argType, int argcx, [lcmaps\\_argument\\_t](#) \*argvx)  
*Get index of argument with name argName.*
- int [lcmaps\\_cntArgs](#) ([lcmaps\\_argument\\_t](#) \*argvx)  
*Count the number of arguments.*

#### 8.12.1 Detailed Description

Public header file to be used by plugins.

##### Author:

Martijn Steenbakkers and Oscar Koeroo for the EU DataGrid.

Routines to access the plugin arguments.

The interface is composed of:

1. [lcmaps\\_setArgValue\(\)](#): Set the value of argument with name argName of argType to value

2. [lcmapi\\_getArgValue\(\)](#): Get the value of argument with name `argName` of `argType`
3. [lcmapi\\_findArgName\(\)](#): Get index of argument with name `argName`
4. [lcmapi\\_cntArgs\(\)](#): Count the number of arguments

Definition in file [lcmapi\\_arguments.h](#).

## 8.12.2 Function Documentation

### 8.12.2.1 [lcmapi\\_cntArgs](#) ([lcmapi\\_argument\\_t](#) \* *argvx*)

Count the number of arguments.

Count the number of arguments that are defined in a plug-in Returns this number.

**Parameters:**

*argvx* array of arguments structures

**Returns:**

the number of arguments

Definition at line 273 of file `lcmapi_arguments.c`.

### 8.12.2.2 [lcmapi\\_findArgName](#) (char \* *argName*, int *argcx*, [lcmapi\\_argument\\_t](#) \* *argvx*)

Get index of argument with name `argName`.

Search for `argName` in the arguments list. Returns the index to `lcmapi_argument_t` element.

**Parameters:**

*argName* name of argument

*argcx* number of arguments

*argvx* array of arguments structures

**Returns:**

index to `lcmapi_argument_t` element

Definition at line 179 of file `lcmapi_arguments.c`.

### 8.12.2.3 [lcmapi\\_findArgNameAndType](#) (char \* *argName*, char \* *argType*, int *argcx*, [lcmapi\\_argument\\_t](#) \* *argvx*)

Get index of argument with name `argName`.

Search for `argName` in the arguments list. Returns the index to `lcmapi_argument_t` element.

**Parameters:**

*argName* name of argument

*argType* type of argument

*argcx* number of arguments

*argvx* array of arguments structures

**Returns:**

index to lmaps\_argument\_t element

Definition at line 230 of file lmaps\_arguments.c.

**8.12.2.4 lmaps\_getArgValue (char \* *argName*, char \* *argType*, int *argcx*, lmaps\_argument\_t \* *argvx*)**

Get the value of argument with name *argName* of *argType*.

Set the value of *argType* on the reserved place in values. The place within values is determined by the place where *argName* is found in the arguments list Returns a void pointer to the value.

**Parameters:**

*argName* name of argument

*argType* type of argument

*argcx* number of arguments

*argvx* array of arguments structures

**Returns:**

void pointer to the value or NULL

Definition at line 131 of file lmaps\_arguments.c.

**8.12.2.5 lmaps\_setArgValue (char \* *argName*, char \* *argType*, void \* *value*, int *argcx*, lmaps\_argument\_t \*\* *argvx*)**

Set the value of argument with name *argName* of *argType* to value.

Set the value of *argType* on the reserved place in values. The place within values is determined by the place where *argName* is found in the arguments list

**Parameters:**

*argName* name of argument

*argType* type of argument

*argcx* number of arguments

*argvx* array of arguments structures

**Returns:**

0 in case of succes

Definition at line 72 of file lmaps\_arguments.c.

## 8.13 lcmapi\_cred\_data.c File Reference

Routines to handle lcmapi credential data.

```
#include <stdio.h>
#include <stdlib.h>
#include <malloc.h>
#include <string.h>
#include "_lcmapi_cred_data.h"
#include "lcmapi_log.h"
#include "lcmapi_vo_data.h"
```

### Functions

- void [printCredData](#) (int [debug\\_level](#))

*Get pointer to a list of credential data of a certain type.*

### 8.13.1 Detailed Description

Routines to handle lcmapi credential data.

#### Author:

Oscar Koeroo and Martijn Steenbakkens for the EU DataGrid.

Definition in file [lcmapi\\_cred\\_data.c](#).

### 8.13.2 Function Documentation

#### 8.13.2.1 [printCredData](#) (int *debug\_level*)

Get pointer to a list of credential data of a certain type.

#### Parameters:

*debug\_level* the debug level

#### Returns:

nothing

Definition at line 320 of file [lcmapi\\_cred\\_data.c](#).

References [cred\\_data\\_s::cntPriGid](#), [cred\\_data\\_s::cntSecGid](#), [cred\\_data\\_s::cntUid](#), [cred\\_data\\_s::cntVoCred](#), [cred\\_data\\_s::cntVoCredMapping](#), [cred\\_data\\_s::cntVoCredString](#), [cred\\_data\\_s::dn](#), [cred\\_data\\_s::priGid](#), [cred\\_data\\_s::secGid](#), [cred\\_data\\_s::uid](#), [cred\\_data\\_s::VoCred](#), [cred\\_data\\_s::VoCredMapping](#), and [cred\\_data\\_s::VoCredString](#).

### 8.13.3 Variable Documentation

#### 8.13.3.1 `cred_data_t credData` `[static]`

**Initial value:**

```
{
    (char *) NULL,
    (uid_t *) NULL,
    (gid_t *) NULL,
    (gid_t *) NULL,
    (lcmaps_vo_data_t *) NULL,
    (char **) NULL,
    (lcmaps_vo_mapping_t *) NULL,
    0,
    0,
    0,
    0,
    0,
    0,
}
```

Definition at line 41 of file lcms\_cred\_data.c.

## 8.14 lcmapi\_cred\_data.h File Reference

Public header file to be used by plugins.

```
#include <pwd.h>
#include "lcmapi_vo_data.h"
```

### Data Structures

- struct [cred\\_data\\_s](#)  
*structure that contains the gathered (local) credentials en VOMS info.*

### Typedefs

- typedef [cred\\_data\\_s cred\\_data\\_t](#)  
*Type of credential data.*

### Functions

- int [addCredentialData](#) (int datatype, void \*data)  
*Add a credential to the list of found credentials (uids, gids etc).*
- void \* [getCredentialData](#) (int datatype, int \*count)  
*Get pointer to a list of credential data of a certain type.*

#### 8.14.1 Detailed Description

Public header file to be used by plugins.

Routines to access the credential data that are gathered by the plugins.

**Author:**

Martijn Steenbakkens and Oscar Koeroo for the EU DataGrid.

Definition in file [lcmapi\\_cred\\_data.h](#).

#### 8.14.2 Function Documentation

##### 8.14.2.1 addCredentialData (int *datatype*, void \* *data*)

Add a credential to the list of found credentials (uids, gids etc).

The credential value is copied into list (memory is allocated for this)

**Parameters:**

*datatype* type of credential  
*data* pointer to credential

**Returns:**

0 in case of succes

Definition at line 84 of file lcms\_cred\_data.c.

**8.14.2.2 getCredentialData (int *datatype*, int \* *count*)**

Get pointer to a list of credential data of a certain type.

**Parameters:**

*datatype* type of credential

*count* number of credentials found in list of datatype (filled by routine)

**Returns:**

pointer to list of credential data or NULL in case of failure

Definition at line 211 of file lcms\_cred\_data.c.

## 8.15 lcmaps\_db\_read.c File Reference

the LCMAPS database reader.

```
#include <stdlib.h>
#include <malloc.h>
#include <stdio.h>
#include <string.h>
#include "lcmaps_log.h"
#include "_lcmaps_db_read.h"
```

### Defines

- #define [PAIR\\_SEP\\_CHARS](#) ","
- #define [VARVAL\\_SEP\\_CHARS](#) "='"
- #define [PAIR\\_TERMINATOR\\_CHARS](#) PAIR\_SEP\_CHARS WHITESPACE\_CHARS
- #define [VARVAL\\_TERMINATOR\\_CHARS](#) VARVAL\_SEP\_CHARS WHITESPACE\_CHARS

### Functions

- int [lcmaps\\_db\\_read\\_entries](#) (FILE \*)  
*Read db entries from stream and fill a list of db entries.*
- int [lcmaps\\_db\\_parse\\_line](#) (char \*, [lcmaps\\_db\\_entry\\_t](#) \*\*)  
*Parses database line and fills database structure.*
- int [lcmaps\\_db\\_parse\\_pair](#) (char \*, char \*\*, char \*\*)  
*Parses a database variable-value pair and returns the variable name and its value.*
- int [lcmaps\\_db\\_parse\\_string](#) (char \*\*)  
*Takes a string and removes prepending and trailing spaces and quotes (unless escaped).*

### Variables

- [lcmaps\\_db\\_entry\\_t](#) \* [lcmaps\\_db\\_list](#) = NULL

#### 8.15.1 Detailed Description

the LCMAPS database reader.

##### Author:

Martijn Steenbakkens for the EU DataGrid.

Definition in file [lcmaps\\_db\\_read.c](#).

## 8.15.2 Define Documentation

### 8.15.2.1 `#define PAIR_SEP_CHARS ”,”`

Characters separating variable-value pairs in the lcms database file

Definition at line 40 of file lcms\_db\_read.c.

Referenced by lcms\_db\_parse\_line.

### 8.15.2.2 `#define PAIR_TERMINATOR_CHARS PAIR_SEP_CHARS WHITESPACE_CHARS`

Characters that terminate pairs in the lcms database file. This is a combination of whitespace and separators.

Definition at line 52 of file lcms\_db\_read.c.

### 8.15.2.3 `#define VARVAL_SEP_CHARS ”=”`

Characters separating variables from values

Definition at line 42 of file lcms\_db\_read.c.

Referenced by lcms\_db\_parse\_pair.

### 8.15.2.4 `#define VARVAL_TERMINATOR_CHARS VARVAL_SEP_CHARS WHITESPACE_CHARS`

Characters that terminate variables and values in the lcms database file. This is a combination of whitespace and separators.

Definition at line 57 of file lcms\_db\_read.c.

## 8.15.3 Function Documentation

### 8.15.3.1 `int lcms_db_parse_line (char * line, lcms_db_entry_t ** entry) [static]`

Parses database line and fills database structure.

#### Parameters:

*line* database line

*entry* pointer to a pointer to a database structure (can/should be freed afterwards)

#### Return values:

*1* succes.

*0* failure.

Definition at line 261 of file lcms\_db\_read.c.

References lcms\_db\_parse\_pair, PAIR\_SEP\_CHARS, lcms\_db\_entry\_s::pluginargs, and lcms\_db\_entry\_s::pluginname.

Referenced by lcms\_db\_read\_entries.

### 8.15.3.2 `int lcmaps_db_parse_pair (char * pair, char ** pvar, char ** pval)` [static]

Parses a database variable-value pair and returns the variable name and its value.

**Parameters:**

- pair* string containing the pair
- pvar* pointer to the variable string
- pval* pointer to the value string

**Return values:**

- 1* succes.
- 0* failure.

Definition at line 397 of file `lcmaps_db_read.c`.

References `lcmaps_db_parse_string`, and `VARVAL_SEP_CHARS`.

Referenced by `lcmaps_db_parse_line`.

### 8.15.3.3 `int lcmaps_db_parse_string (char ** pstring)` [static]

Takes a string and removes prepending and trailing spaces and quotes (unless escaped).

**Parameters:**

- pstring* pointer to a pointer to a char

**Return values:**

- 1* succes.
- 0* failure.

Definition at line 494 of file `lcmaps_db_read.c`.

Referenced by `lcmaps_db_parse_pair`.

### 8.15.3.4 `int lcmaps_db_read_entries (FILE * dbstream)` [static]

Read db entries from stream and fill a list of db entries.

**Parameters:**

- dbstream* database stream

**Returns:**

- the number of entries found (failure -> negative number)

Definition at line 132 of file `lcmaps_db_read.c`.

References `lcmaps_db_fill_entry`, `lcmaps_db_parse_line`, `lcmaps_db_entry_s::pluginargs`, and `lcmaps_db_entry_s::pluginname`.

## 8.15.4 Variable Documentation

### 8.15.4.1 `lcmaps_db_entry_t*` `lcmaps_db_list` = `NULL` `[static]`

list of database entries

Definition at line 74 of file `lcmaps_db_read.c`.

## 8.16 lcmaps\_db\_read.h File Reference

header file for LCMAPS database structure.

```
#include "lcmaps_defines.h"
```

### Data Structures

- struct [lcmaps\\_db\\_entry\\_s](#)  
*LCMAPS data base element structure.*

### Typedefs

- typedef [lcmaps\\_db\\_entry\\_s](#) [lcmaps\\_db\\_entry\\_t](#)  
*type of LCMAPS data base element.*

#### 8.16.1 Detailed Description

header file for LCMAPS database structure.

**Author:**

Martijn Steenbakkers for the EU DataGrid.

This header contains the declarations of the LCMAPS database structure

Definition in file [lcmaps\\_db\\_read.h](#).

## 8.17 lcms\_defines.h File Reference

Public header file with common definitions for the LCMAPS (authorization modules).

### 8.17.1 Detailed Description

Public header file with common definitions for the LCMAPS (authorization modules).

**Author:**

Martijn Steenbakkens for the EU DataGrid.

Here the return values for the LCMAPS plugins/modules are defined as well as the default locations of the LCMAPS "etc", "lib" and "modules" directories.

Definition in file [lcmaps\\_defines.h](#).

## 8.18 lcmaps\_dummy\_bad.c File Reference

Interface to the LCMAPS plugins.

```
#include "lcmaps_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
```

### 8.18.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains code for a dummy LCMAPS plugin that always returns NOT OK. the plugin has to provide to the LCMAPS. The interface consists of the following functions:

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_dummy\\_bad.c](#).

## 8.19 lcms\_dummy\_good.c File Reference

Interface to the LCMAPS plugins.

```
#include "lcmaps_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
```

### 8.19.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains code for a dummy LCMAPS plugin that always returns OK. the plugin has to provide to the LCMAPS. The interface consists of the following functions:

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_dummy\\_good.c](#).

## 8.20 lcmaps\_gss\_assist\_gridmap.c File Reference

legacy interface for LCMAPS.

```
#include "lcmaps_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <gssapi.h>
#include <pwd.h>
#include "lcmaps.h"
#include "lcmaps_log.h"
#include "lcmaps_cred_data.h"
```

### 8.20.1 Detailed Description

legacy interface for LCMAPS.

**Author:**

Martijn Steenbakkers for the EU DataGrid.

The legacy interface to the LCMAPS module is the original gridmap interface provided by globus. Given the user distinguished name (DN) a username is returned, based on the gridmap file

1. globus\_gss\_assist\_gridmap: the interface

Definition in file [lcmaps\\_gss\\_assist\\_gridmap.c](#).

## 8.21 lcms\_jobrep.c File Reference

Plugin to get data for the Job Repository Database.

```
#include "lcmaps_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <ctype.h>
#include <string.h>
#include <pwd.h>
#include <openssl/x509.h>
#include <openssl/asn1.h>
#include "gssapi.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
#include "lcmaps_voms_utils.h"
#include "lcmaps_vo_data.h"
#include "voms_apic.h"
#include "globus_gss_assist.h"
#include "jobrep_api.h"
```

### Functions

- int [lcmaps\\_get\\_jobrep\\_config](#) (const char \*, char \*\*)  
*Get the Job Repository configuration from file.*
- int [plugin\\_initialize](#) (int argc, char \*\*argv)  
*initialize the plugin.*
- int [plugin\\_introspect](#) (int \*argc, [lcmaps\\_argument\\_t](#) \*\*argv)  
*Plugin asks for required arguments.*
- int [plugin\\_run](#) (int argc, [lcmaps\\_argument\\_t](#) \*argv)  
*Gather credentials for user making use of the ordered arguments.*
- int [plugin\\_terminate](#) ()  
*Whatever is needed to terminate the plugin module goes in here.*

### 8.21.1 Detailed Description

Plugin to get data for the Job Repository Database.

**Author:**

Oscar Koeroo for the EU DataGrid.

Definition in file [lcmaps\\_jobrep.c](#).

**8.21.2 Function Documentation****8.21.2.1 int lcmaps\_get\_jobrep\_config (const char \* *path*, char \*\* *jobrep\_config*) [static]**

Get the Job Repository configuration from file.

This function tries to read the Job Repository configuration from the `jobrep_config` file. It also tests if the access bits of the file are correctly set.

**Parameters:**

*path* the path to the `jobrep_config` file containing the config string.

*jobrep\_config* variable to set the configuration string in

**Return values:**

*0* success

*1* other failure

Definition at line 2278 of file `lcmaps_jobrep.c`.

Referenced by `plugin_initialize`.

**8.21.2.2 int plugin\_initialize (int *argc*, char \*\* *argv*)**

initialize the plugin.

[plugin\\_initialize](#)(int argc, char \*\*argv)

Everything that is needed to initialize the plugin should be put inside this function. Arguments as read from the LCMAPS database (*argc*, *argv*) are passed to the plugin.

**Parameters:**

*argc* number of passed arguments.

*argv* argument list. `argv[0]` contains the name of the plugin.

**Return values:**

**LCMAPS\_MOD\_SUCCESS** successful initialization

**LCMAPS\_MOD\_FAIL** failure in the plugin initialization

**LCMAPS\_MOD\_NOFILE** private plugin database could not be found (same effect as **LCMAPS\_MOD\_FAIL**)

Definition at line 453 of file `lcmaps_jobrep.c`.

References `lcmaps_get_jobrep_config`.

### 8.21.2.3 int plugin\_introspect (int \* *argc*, lcms\_argument\_t \*\* *argv*)

Plugin asks for required arguments.

[plugin\\_introspect](#)(int \**argc*, lcms\_argument\_t \*\**argv*)

**Parameters:**

*int* \**argc*

lcms\_argument\_t \*\**argv*

**Return values:**

**LCMAPS\_MOD\_SUCCESS** success

**LCMAPS\_MOD\_FAIL** failure (will result in a lcms failure)

Definition at line 574 of file lcms\_jobrep.c.

### 8.21.2.4 int plugin\_run (int *argc*, lcms\_argument\_t \* *argv*)

Gather credentials for user making use of the ordered arguments.

[plugin\\_run](#)(int *argc*, lcms\_argument\_t \**argv*)

Ask for credentials by passing the arguments (like JDL, globus DN, VOMS roles etc.) that were ordered earlier by the [plugin\\_introspect](#)() function

**Parameters:**

*argc* number of arguments

*argv* list of arguments

**Return values:**

**LCMAPS\_MOD\_SUCCESS** authorization succeeded

**LCMAPS\_MOD\_FAIL** authorization failed

Definition at line 610 of file lcms\_jobrep.c.

### 8.21.2.5 int plugin\_terminate ()

Whatever is needed to terminate the plugin module goes in here.

[plugin\\_terminate](#)()

**Return values:**

**LCMAPS\_MOD\_SUCCESS** success

**LCMAPS\_MOD\_FAIL** failure (will result in an authorization failure)

Definition at line 2033 of file lcms\_jobrep.c.

## 8.22 lcmaps\_ldap.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include <grp.h>
#include <ctype.h>
#include <errno.h>
#include "globus_gss_assist.h"
#include "lcmaps_config.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
#include "ldap.h"
```

### Functions

- `int lcmaps_get_ldap_pw` (const char \*path, char \*\*ldap\_passwd)  
*Get the LDAP password from file.*
- `int lcmaps_set_pgid` (const char \*username, const char \*pgroupname, gid\_t pgroupnumber, LDAP \*ld\_handle, const char \*searchBase)  
*Sets the primary group ID.*
- `int lcmaps_add_username_to_ldapgroup` (const char \*username, const char \*groupname, gid\_t groupnumber, LDAP \*ld\_handle, const char \*searchBase)  
*Adds the username to the appropriate (LDAP) group.*

### 8.22.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Wim Som de Cerff and Martijn Steenbakkers for the EU DataGrid.

This file contains the code for the ldap LCMAPS plugin. The interface consists of the following functions:

1. `plugin_initialize()`
2. `plugin_run()`
3. `plugin_terminate()`

4. [plugin\\_introspect\(\)](#)

The following internal functions are available:

1. [lcmaps\\_set\\_pgid\(\)](#)
2. [lcmaps\\_add\\_username\\_to\\_ldapgroup\(\)](#)

Definition in file [lcmaps\\_ldap.c](#).

## 8.22.2 Function Documentation

### 8.22.2.1 `int lcmaps_add_username_to_ldapgroup (const char * username, const char * groupname, gid_t groupnumber, LDAP * ld_handle, const char * searchBase) [static]`

Adds the username to the appropriate (LDAP) group.

This function tries to add the username to the list of usernames belonging to the group with name *groupname* and gid *groupnumber* in the posixGroup LDAP structure. If the group does not exist, -1 is returned.

**Parameters:**

*username* the name of the user  
*groupname* the name of the group  
*groupnumber* group id number  
*ld\_handle* handle to LDAP  
*searchBase* dn search base

**Return values:**

0 success  
-1 ldap failure  
1 other failure

Definition at line 1016 of file [lcmaps\\_ldap.c](#).

### 8.22.2.2 `int lcmaps_get_ldap_pw (const char * path, char ** ldap_passwd) [static]`

Get the LDAP password from file.

This function tries to read the LDAP password from the *ldap\_pw* file. It also tests if the access bits of the file are correctly set.

**Parameters:**

*path* the path to the *ldap\_pw* file containing the password.  
*ldap\_passwd* variable to set the password in

**Return values:**

0 success  
1 other failure

Definition at line 1363 of file [lcmaps\\_ldap.c](#).

### 8.22.2.3 `int lcmapi_set_pgid (const char * username, const char * pgrouppname, gid_t pgrouppnumber, LDAP * ld_handle, const char * searchBase)` [static]

Sets the primary group ID.

This function tries to set the primary group in the posixAccount LDAP structure for the user "username".

#### Parameters:

*username* the name of the user  
*pgrouppname* the name of the primary group  
*pgrouppnumber* primary group id number  
*ld\_handle* handle to LDAP  
*searchBase* dn search base

#### Return values:

*0* success  
*-1* ldap failure  
*1* other failure

Definition at line 1255 of file lcmapi\_ldap.c.

## 8.22.3 Variable Documentation

### 8.22.3.1 `struct timeval timeout` [static]

#### Initial value:

```
{  
    (time_t) 0,  
    (suseconds_t) 0  
}
```

Definition at line 177 of file lcmapi\_ldap.c.

## 8.23 lcmsaps\_localaccount.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include "lcmaps_config.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
#include "lcmaps_gridlist.h"
```

### 8.23.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code for localaccount plugin

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_localaccount.c](#).

## 8.24 lcmaps\_log.c File Reference

Logging routines for LCMAPS.

```
#include <stdlib.h>
#include <stdio.h>
#include <string.h>
#include <errno.h>
#include <stdarg.h>
#include <syslog.h>
#include <time.h>
#include <ctype.h>
#include "_lcmaps_log.h"
```

### Variables

- FILE \* [lcmaps\\_logfp](#) = NULL
- int [logging\\_usrlog](#) = 0
- int [logging\\_syslog](#) = 0
- int [debug\\_level](#) = 0
- char \* [extra\\_logstr](#) = NULL
- int [should\\_close\\_lcmaps\\_logfp](#) = 0

### 8.24.1 Detailed Description

Logging routines for LCMAPS.

#### Author:

Martijn Steenbakkens for the EU DataGrid.

Definition in file [lcmaps\\_log.c](#).

### 8.24.2 Variable Documentation

#### 8.24.2.1 int debug\_level = 0 [static]

debugging level

Definition at line 45 of file [lcmaps\\_log.c](#).

#### 8.24.2.2 char\* extra\_logstr = NULL [static]

string to be included in every log statement

Definition at line 46 of file [lcmaps\\_log.c](#).

**8.24.2.3 FILE\* lcms\_logfp = NULL** [static]

stream associated with logfile

Definition at line 41 of file lcms\_log.c.

**8.24.2.4 int logging\_syslog = 0** [static]

flag to use syslog

Definition at line 43 of file lcms\_log.c.

**8.24.2.5 int logging\_usrlog = 0** [static]

flag to do user logging

Definition at line 42 of file lcms\_log.c.

**8.24.2.6 int should\_close\_lcms\_logfp = 0** [static]

Flag to check if the log stream should be closed

Definition at line 47 of file lcms\_log.c.

## 8.25 lcmaps\_log.h File Reference

Logging API for the LCMAPS plugins and LCMAPS itself.

```
#include <syslog.h>
```

### Functions

- `int lcmaps_log (int prty, char *fmt,...)`  
*log information.*
- `int lcmaps_log_debug (int debug_lvl, char *fmt,...)`  
*Print debugging information.*
- `int lcmaps_log_time (int prty, char *fmt,...)`  
*log information with timestamp.*

### 8.25.1 Detailed Description

Logging API for the LCMAPS plugins and LCMAPS itself.

**Author:**

Martijn Steenbakkers for the EU DataGrid.

This header contains the declarations of the LCMAPS logging functions. The LCMAPS plugins can use this API to write output to the LCMAPS logging devices.

1. `lcmaps_log()`: Log to LCMAPS logging devices.
2. `lcmaps_log_debug()`: Produce debugging output.

Definition in file `lcmaps_log.h`.

### 8.25.2 Function Documentation

#### 8.25.2.1 `lcmaps_log (int prty, char *fmt, ...)`

log information.

This function logs information for LCMAPS and its plugins. `Syslog()` is called with the specified priority. No `syslog()` is done if the priority is 0.

**Parameters:**

*prty* syslog priority (if 0 don't syslog).  
*fmt* string format  
... variable argument list

**Return values:**

0 succes.  
1 failure.

Definition at line 217 of file `lcmaps_log.c`.

### 8.25.2.2 lcms\_log\_debug (int *debug\_lvl*, char \**fmt*, ...)

Print debugging information.

This function prints debugging information (using lcms\_log with priority 0) provided debug\_lvl <= DEBUG\_LEVEL (default is 0).

**Parameters:**

*debug\_lvl* debugging level

*fmt* string format

... variable argument list

**Return values:**

0 succes.

1 failure.

Definition at line 284 of file lcms\_log.c.

### 8.25.2.3 lcms\_log\_time (int *prty*, char \**fmt*, ...)

log information with timestamp.

This function logs information with a timestamp for LCMAPS and its plugins. Syslog() is called with the specified priority. No syslog() is done if the priority is 0.

**Parameters:**

*prty* syslog priority (if 0 don't syslog).

*fmt* string format

... variable argument list

**Return values:**

0 succes.

1 failure.

Definition at line 371 of file lcms\_log.c.

## 8.26 lcmapi\_modules.h File Reference

The LCMAPS authorization plugins/modules should "include" this file.

```
#include <gssapi.h>
#include "lcmapi_utils.h"
#include "lcmapi_log.h"
#include "lcmapi_types.h"
#include "lcmapi_defines.h"
```

### 8.26.1 Detailed Description

The LCMAPS authorization plugins/modules should "include" this file.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file includes the header files that are needed by the LCMAPS authorization plugins/modules.

Definition in file [lcmapi\\_modules.h](#).

## 8.27 lcms\_plugin\_example.c File Reference

Interface to the LCMAPS plugins.

```
#include "lcmaps_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
```

### 8.27.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Gerben Venekamp for the EU DataGrid.

This file contains the code for an example LCMAPS plugin and shows the interface the plugin has to provide to the LCMAPS. The interface consists of the following functions:

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_plugin\\_example.c](#).

## 8.28 lcmapi\_pluginmanager.c File Reference

the plugin manager for LCMAPS.

```
#include "lcmapi_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <malloc.h>
#include <dlfcn.h>
#include <gssapi.h>
#include "lcmapi_types.h"
#include "lcmapi_log.h"
#include "lcmapi_arguments.h"
#include "lcmapi_defines.h"
#include "_lcmapi_utils.h"
#include "_lcmapi_db_read.h"
#include "_lcmapi_runvars.h"
#include "_lcmapi_cred_data.h"
#include "../evaluationmanager/evaluationmanager.h"
```

### Data Structures

- struct [lcmapi\\_plugin\\_t](#)  
*the lcmapi plugin module structure.*

### Typedefs

- typedef int(\* [lcmapi\\_proc\\_t](#))()  
*this type corresponds to the types of the plugin interface functions.*
- typedef [lcmapi\\_plugin\\_t](#) [lcmapi\\_plugin\\_t](#)  
*the type definition of the lcmapi plugin module structure.*

### Enumerations

- enum [lcmapi\\_proctype\\_e](#) { [INITPROC](#), [RUNPROC](#), [TERMPROC](#), [INTROPROC](#) }  
*This enumeration type gives the different plugin symbol/function types.*

## Functions

- [lcmaps\\_plugin\\_t \\* PluginInit](#) ([lcmaps\\_db\\_entry\\_t \\*](#), [lcmaps\\_plugin\\_t \\*\\*](#))  
*Initialize the plugin.*
- [lcmaps\\_proc\\_t get\\_procsymbol](#) ([void \\*](#), [char \\*](#))  
*get procedure symbol from dlopen-ed library.*
- [int print\\_lcms\\_plugin](#) ([int](#), [lcmaps\\_plugin\\_t \\*](#))  
*print the lcms\_plugin\_t structure.*
- [int parse\\_args\\_plugin](#) ([const char \\*](#), [const char \\*](#), [char \\*\\*](#), [int \\*](#))  
*convert plugin argument string into xargc, xargv.*
- [int clean\\_plugin\\_list](#) ([lcmaps\\_plugin\\_t \\*\\*](#))  
*clean (free) the list of plugins and call the plugin termination functions.*

### 8.28.1 Detailed Description

the plugin manager for LCMAPS.

#### Author:

Martijn Steenbakkens for the EU DataGrid.

The interface to the PluginManager module is composed of:

1. [startPluginManager\(\)](#): start the PluginManager → load plugins, start evaluation manager
2. [runPluginManager\(\)](#): run the PluginManager → run evaluation manager → run plugins
3. [stopPluginManager\(\)](#): stop the PluginManager
4. [reloadPluginManager\(\)](#): reload the PluginManager ? (will we implement this ?)
5. [runPlugin\(\)](#): run the specified plugin. (used by Evaluation Manager)
6. [resetCredentialData\(\)](#): reset the Credential Data. (used by Evaluation Manager)

Definition in file [lcmaps\\_pluginmanager.c](#).

### 8.28.2 Enumeration Type Documentation

#### 8.28.2.1 enum lcms\_proctype\_e

This enumeration type gives the different plugin symbol/function types.

#### Enumeration values:

- INITPROC** this value corresponds to the plugin initialization function
- RUNPROC** this value corresponds to the plugin run function (get credentials)
- TERMPROC** this value corresponds to the plugin termination function
- INTROPROC** this value corresponds to the plugin introspect function

Definition at line 77 of file [lcmaps\\_pluginmanager.c](#).

### 8.28.3 Function Documentation

#### 8.28.3.1 `int clean_plugin_list (lcmapi_plugin_t ** list) [static]`

clean (free) the list of plugins and call the plugin termination functions.

**Parameters:**

*list*

*list* pointer to list of plugins which has to be freed.

**Return values:**

*0* succes.

*1* failure.

Definition at line 781 of file lcmapi\_pluginmanager.c.

References lcmapi\_plugin\_t::handle, lcmapi\_plugin\_t::init\_argc, lcmapi\_plugin\_t::init\_argv, lcmapi\_plugin\_t::next, lcmapi\_plugin\_t::pluginname, lcmapi\_plugin\_t::procs, and TERMPROC.

#### 8.28.3.2 `lcmapi_proc_t get_procsymbol (void * handle, char * symname) [static]`

get procedure symbol from dlopen-ed library.

**Parameters:**

*handle* handle of dynamic library

*symname* name of procedure symbol

**Returns:**

handle to procedure symbol or NULL

Definition at line 639 of file lcmapi\_pluginmanager.c.

References lcmapi\_proc\_t.

Referenced by PluginInit.

#### 8.28.3.3 `int parse_args_plugin (const char * name, const char * argstring, char ** xargv, int * xargc) [static]`

convert plugin argument string into xargc, xargv.

Parse the argument string of the plugin and create xargv and xargc

**Parameters:**

*name* name of the plugin (goes into xargv[0])

*argstring* string containing the arguments

*xargv* array of argument strings (has to be freed later)

*xargc* number of arguments

**Return values:**

*0* succes.

*1* failure.

Definition at line 578 of file lcmapi\_pluginmanager.c.

Referenced by PluginInit.

### 8.28.3.4 `lcmaps_plugin_t * PluginInit (lcmaps_db_entry_t * db_handle, lcmaps_plugin_t ** list)` `[static]`

Initialize the plugin.

This function takes a plugin LCMAPS database entry and performs the following tasks:

- Create entry in (plugin)list
- Open the plugins and check the symbols plugin\_init and confirm\_authorization
- run plugin\_init

#### Parameters:

*db\_handle* handle to LCMAPS db (containing pluginname and pluginargs)

*list* pointer to plugin structure list to which (plugin) module has to be added

#### Returns:

pointer to newly created plugin structure or NULL in case of failure

Definition at line 354 of file lcms\_pluginmanager.c.

References `get_procsymbol`, `lcmaps_plugin_t::handle`, `lcmaps_plugin_t::init_argc`, `lcmaps_plugin_t::init_argv`, `INITPROC`, `INTROPROC`, `lcmaps_proc_t`, `lcmaps_plugin_t::next`, `parse_args_plugin`, `lcmaps_plugin_t::pluginargs`, `lcmaps_db_entry_t::pluginargs`, `lcmaps_plugin_t::pluginname`, `lcmaps_db_entry_t::pluginname`, `lcmaps_plugin_t::procs`, `lcmaps_plugin_t::run_argc`, `lcmaps_plugin_t::run_argv`, `RUNPROC`, and `TERMPROC`.

### 8.28.3.5 `int print_lcms_plugin (int debug_lvl, lcmaps_plugin_t * plugin)` `[static]`

print the `lcmaps_plugin_t` structure.

#### Parameters:

*debug\_lvl* debugging level

*plugin* plugin structure

#### Return values:

*0* succes.

*1* failure.

Definition at line 680 of file lcms\_pluginmanager.c.

References `lcmaps_plugin_t::handle`, `lcmaps_plugin_t::init_argc`, `lcmaps_plugin_t::init_argv`, `INITPROC`, `INTROPROC`, `lcmaps_plugin_t::next`, `lcmaps_plugin_t::pluginargs`, `lcmaps_plugin_t::pluginname`, `lcmaps_plugin_t::procs`, `lcmaps_plugin_t::run_argc`, `lcmaps_plugin_t::run_argv`, `RUNPROC`, and `TERMPROC`.

## 8.29 lcmapi\_poolaccount.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include "lcmapi_config.h"
#include "lcmapi_modules.h"
#include "lcmapi_arguments.h"
#include "lcmapi_cred_data.h"
#include "lcmapi_gridlist.h"
```

### 8.29.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code of the poolaccount plugin

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmapi\\_poolaccount.c](#).

## 8.30 lcms\_posix.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include <grp.h>
#include <ctype.h>
#include "lcmaps_config.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
```

### 8.30.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code for the posix process enforcement LCMAPS plugin

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_posix.c](#).

## 8.31 lcmapi\_runvars.c File Reference

Extract variables that will be used by the plugins.

```
#include "lcmapi_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <gssapi.h>
#include "lcmapi_log.h"
#include "lcmapi_types.h"
#include "lcmapi_utils.h"
#include "lcmapi_arguments.h"
#include "_lcmapi_runvars.h"
```

### 8.31.1 Detailed Description

Extract variables that will be used by the plugins.

#### Author:

Martijn Steenbakkens for the EU DataGrid.

This module takes the data that are presented to LCMAPS (the global credential and Job request) and extracts the variables that will be used by the plugins from it and stores them into a list. The interface to the LCMAPS module is composed of:

1. [lcmapi\\_extractRunVars\(\)](#): takes the global credential and Job request and extracts run variables from them
2. [lcmapi\\_setRunVars\(\)](#): adds run variables to a list
3. [lcmapi\\_getRunVars\(\)](#): gets run variables from list

Definition in file [lcmapi\\_runvars.c](#).

### 8.31.2 Variable Documentation

#### 8.31.2.1 [lcmapi\\_argument\\_t runvars\\_list\[\]](#) [static]

  { NULL          , NULL          , -1, NULL}
}
```

Definition at line 58 of file [lcmapi\\_runvars.c](#).

## 8.32 lcms\_types.h File Reference

Public header file with typedefs for LCMAPS.

```
#include <gssapi.h>
```

### Data Structures

- struct [lcmaps\\_cred\\_id\\_s](#)  
*structure representing an LCMAPS credential.*

### Typedefs

- typedef char \* [lcmaps\\_request\\_t](#)  
*Type of the LCMAPS request expressed in RSL/JDL.*
- typedef [lcmaps\\_cred\\_id\\_s](#) [lcmaps\\_cred\\_id\\_t](#)  
*Type of LCMAPS credentials.*

#### 8.32.1 Detailed Description

Public header file with typedefs for LCMAPS.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

Definition in file [lcmaps\\_types.h](#).

#### 8.32.2 Typedef Documentation

##### 8.32.2.1 lcms\_request\_t

Type of the LCMAPS request expressed in RSL/JDL.

(Internal) just a string.

Definition at line 37 of file [lcmaps\\_types.h](#).

Referenced by [lcmaps\\_init\\_and\\_log](#).

## 8.33 lcmapi\_utils.c File Reference

the utilities for the LCMAPS.

```
#include <stdlib.h>
#include <stdio.h>
#include <string.h>
#include <sys/types.h>
#include <sys/stat.h>
#include <unistd.h>
#include <errno.h>
#include <stdarg.h>
#include <gssapi.h>
#include <grp.h>
#include "lcmapi_defines.h"
#include "lcmapi_types.h"
#include "lcmapi_log.h"
```

### Functions

- char \* [cred\\_to\\_dn](#) (gss\_cred\_id\_t)  
*Get the globus DN from GLOBUS credential (gssapi).*
- int [fexist](#) (char \*)  
*check the existence of file corresponding to <path>.*

### 8.33.1 Detailed Description

the utilities for the LCMAPS.

#### Author:

Martijn Steenbakkens for the EU DataGrid.

Definition in file [lcmapi\\_utils.c](#).

### 8.33.2 Function Documentation

#### 8.33.2.1 char \* cred\_to\_dn (gss\_cred\_id\_t globus\_cred) [static]

Get the globus DN from GLOBUS credential (gssapi).

(copied and modified from GLOBUS gatekeeper.c)

#### Parameters:

*globus\_cred* GLOBUS credential

**Returns:**

globus DN string (which may be freed)

Definition at line 178 of file lcms\_utils.c.

**8.33.2.2 int fexist (char \**path*) [static]**

check the existence of file corresponding to <path>.

**Parameters:**

*path* absolute filename to be checked.

**Return values:**

*1* file exists.

*0* failure.

Definition at line 306 of file lcms\_utils.c.

## 8.34 lcmapi\_utils.h File Reference

API for the utilities for the LCMAPS.

```
#include <gssapi.h>
#include "lcmapi_types.h"
#include <grp.h>
```

### CREDENTIAL FUNCTIONS

- char \* [lcmapi\\_get\\_dn](#) ([lcmapi\\_cred\\_id\\_t](#) lcmapi\_credential)  
*Retrieve user DN from (LCMAPS) credential.*

### FILENAME FUNCTIONS

- char \* [lcmapi\\_genfilename](#) (char \*prefix, char \*[path](#), char \*suffix)  
*Generate an absolute file name.*
- char \* [lcmapi\\_getfexist](#) (int n,...)  
*Picks the first existing file in argument list.*
- char \* [lcmapi\\_findfile](#) (char \*name)  
*Checks for file in standard directories.*

### Functions

- int [lcmapi\\_get\\_gidlist](#) (const char \*username, int \*ngroups, gid\_t \*\*group\_list)  
*Finds the list of gids for user in the group file (/etc/group).*

#### 8.34.1 Detailed Description

API for the utilities for the LCMAPS.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This header contains the declarations of the LCMAPS utility functions:

1. [lcmapi\\_get\\_dn](#)():
2. [lcmapi\\_genfilename](#)():
3. [lcmapi\\_getfexist](#)():
4. [lcmapi\\_findfile](#)():
5. [lcmapi\\_findfile](#)():

6. [lcm\\_utils\\_get\\_gidlist\(\)](#):

Definition in file [lcm\\_utils.h](#).

## 8.34.2 Function Documentation

### 8.34.2.1 lcm\_utils\_findfile (char \* *name*)

Checks for file in standard directories.

The directories that are checked are:

- current directory
- "modules"
- LCMAPS\_ETC\_HOME
- LCMAPS\_MOD\_HOME
- LCMAPS\_LIB\_HOME

**Parameters:**

*name* string containing the file name

**Returns:**

pointer to a string containing the absolute path to the file, which has to be freed or NULL.

Definition at line 391 of file lcm\_utils.c.

### 8.34.2.2 lcm\_utils\_genfilename (char \* *prefix*, char \* *path*, char \* *suffix*)

Generate an absolute file name.

Given a starting prefix, a relative or absolute path, and a suffix an absolute file name is generated. Uses the prefix only if the path is relative. (Copied (and modified) from GLOBUS gatekeeper.c)

**Parameters:**

*prefix* string containing the prefix to be prepended.

*path* relative/absolute path to file name.

*suffix* string containing the suffix to be appended.

**Returns:**

pointer to a string containing the absolute path to the file, which has to be freed.

Definition at line 249 of file lcm\_utils.c.

### 8.34.2.3 lcm\_utils\_get\_dn (lcm\_utils\_cred\_id\_t *lcm\_utils\_credential*)

Retrieve user DN from (LCMAPS) credential.

This function takes an LCMAPS credential as input and returns the corresponding user distinguished name (DN).

(Internal:) If the GLOBUS credential part of the LCMAPS credential is empty the user DN is already included in the LCMAPS credential.

**Parameters:**

*lcmaps\_credential* the LCMAPS credential

**Returns:**

a string containing the user DN

Definition at line 153 of file lcmaps\_utils.c.

**8.34.2.4 lcmaps\_get\_gidlist (const char \* username, int \* ngroups, gid\_t \*\* group\_list)**

Finds the list of gids for user in the group file (/etc/group).

Returns a list of gid\_t which should be freed by calling program.

**Parameters:**

*username* the name of the user

*ngroups* ptr to int which will be filled with the number of gids

*group\_list* ptr to an array of gid\_t

**Return values:**

*0* success

*-1* realloc failure

*-2* getgrent failure

*1* failure

Definition at line 579 of file lcmaps\_utils.c.

**8.34.2.5 lcmaps\_getfexist (int n, ...)**

Picks the first existing file in argument list.

**Parameters:**

*n* the number of paths presented in the following argument list.

*...* variable argument list of paths.

**Returns:**

filename found or NULL

Definition at line 349 of file lcmaps\_utils.c.

## 8.35 lcmsaps\_vo\_data.c File Reference

LCMAPS utilities for creating and accessing VO data structures.

```
#include <stdio.h>
#include <stdlib.h>
#include <malloc.h>
#include <string.h>
#include "lcmaps_vo_data.h"
#include "lcmaps_log.h"
```

### 8.35.1 Detailed Description

LCMAPS utilities for creating and accessing VO data structures.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

The interface is composed of:

1. [lcmaps\\_createVoData\(\)](#): create a VoData structure
2. [lcmaps\\_deleteVoData\(\)](#): delete a VoData structure
3. [lcmaps\\_copyVoData\(\)](#): copy (the contents of) a VoData structure
4. [lcmaps\\_printVoData\(\)](#): print the contents of a VoData structure
5. [lcmaps\\_stringVoData\(\)](#): cast a VoData structure into a string

Definition in file [lcmaps\\_vo\\_data.c](#).

## 8.36 lcmaps\_vo\_data.h File Reference

LCMAPS module for creating and accessing VO data structures.

```
#include <grp.h>
```

### Data Structures

- struct [lcmaps\\_vo\\_data\\_s](#)  
*structure that contains the VO information found in the user's gss credential.*
- struct [lcmaps\\_vo\\_mapping\\_s](#)  
*structure that contains the VO information string (or FQAN) and the local Gid it is mapped to.*

### Typedefs

- typedef [lcmaps\\_vo\\_data\\_s](#) [lcmaps\\_vo\\_data\\_t](#)  
*Type of VO information structure.*
- typedef [lcmaps\\_vo\\_mapping\\_s](#) [lcmaps\\_vo\\_mapping\\_t](#)  
*Type of VO mapping structure.*

### Functions

- [lcmaps\\_vo\\_data\\_t](#) \* [lcmaps\\_createVoData](#) (const char \*vo, const char \*group, const char \*subgroup, const char \*role, const char \*capability)  
*Create a VoData structure.*
- int [lcmaps\\_deleteVoData](#) ([lcmaps\\_vo\\_data\\_t](#) \*\*vo\_data)  
*Delete a VoData structure.*
- int [lcmaps\\_cleanVoData](#) ([lcmaps\\_vo\\_data\\_t](#) \*vo\_data)  
*Clean a VoData structure.*
- int [lcmaps\\_copyVoData](#) ([lcmaps\\_vo\\_data\\_t](#) \*dst\_vo\_data, const [lcmaps\\_vo\\_data\\_t](#) \*src\_vo\_data)  
*Copy a VoData structure into an empty VoData structure.*
- int [lcmaps\\_printVoData](#) (int debug\_level, const [lcmaps\\_vo\\_data\\_t](#) \*vo\_data)  
*Print the contents of a VoData structure.*
- int [lcmaps\\_stringVoData](#) (const [lcmaps\\_vo\\_data\\_t](#) \*vo\_data, char \*buffer, int nchars)  
*Cast a VoData structure into a string.*
- [lcmaps\\_vo\\_mapping\\_t](#) \* [lcmaps\\_createVoMapping](#) (const char \*vo\_data\_string, const char \*groupname, const gid\_t gid)  
*Create a VoMapping structure.*

- `int lcmsaps_deleteVoMapping (lcmaps_vo_mapping_t **vo_mapping)`  
*Delete a VoMapping structure.*
- `int lcmsaps_cleanVoMapping (lcmaps_vo_mapping_t *vo_mapping)`  
*Clean a VoMapping structure.*
- `int lcmsaps_copyVoMapping (lcmaps_vo_mapping_t *dst_vo_mapping, const lcmsaps_vo_mapping_t *src_vo_mapping)`  
*Copy a VoMapping structure into an empty VoMapping structure.*
- `int lcmsaps_printVoMapping (int debug_level, const lcmsaps_vo_mapping_t *vo_mapping)`  
*Print the contents of a VoMapping structure.*

### 8.36.1 Detailed Description

LCMAPS module for creating and accessing VO data structures.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

The interface is composed of:

1. `lcmaps_createVoData()`: create a VoData structure
2. `lcmaps_deleteVoData()`: delete a VoData structure
3. `lcmaps_cleanVoData()`: clean a VoData structure
4. `lcmaps_copyVoData()`: copy (the contents of) a VoData structure
5. `lcmaps_printVoData()`: print the contents of a VoData structure
6. `lcmaps_stringVoData()`: cast a VoData structure into a string
7. `lcmaps_createVoMapping()`: create a VoMapping structure
8. `lcmaps_deleteVoMapping()`: delete a VoMapping structure
9. `lcmaps_cleanVoMapping()`: clean a VoMapping structure
10. `lcmaps_copyVoMapping()`: copy (the contents of) a VoMapping structure
11. `lcmaps_printVoMapping()`: print the contents of a VoMapping structure

Definition in file `lcmaps_vo_data.h`.

### 8.36.2 Function Documentation

#### 8.36.2.1 `lcmaps_cleanVoData (lcmaps_vo_data_t * vo_data)`

Clean a VoData structure.

Clean a VoData structure that was previously filled with `lcmaps_copyVoData()`. The contents are freed and set to zero.

**Parameters:**

*vo\_data* a pointer to a VoData structure

**Return values:**

*0* in case of success

*-1* in case of failure

Definition at line 195 of file lcm maps\_vo\_data.c.

**8.36.2.2 lcm maps\_cleanVoMapping (lcm maps\_vo\_mapping\_t \* vo\_mapping)**

Clean a VoMapping structure.

Clean a VoMapping structure that was previously filled with `lcm maps_copyVoMapping()`. The contents are freed and set to zero.

**Parameters:**

*vo\_mapping* a pointer to a VoMapping structure

**Return values:**

*0* in case of success

*-1* in case of failure

Definition at line 682 of file lcm maps\_vo\_data.c.

**8.36.2.3 lcm maps\_copyVoData (lcm maps\_vo\_data\_t \* dst\_vo\_data, const lcm maps\_vo\_data\_t \* src\_vo\_data)**

Copy a VoData structure into an empty VoData structure.

Copy a VoData structure into an empty VoData structure which has to exist.

**Parameters:**

*dst\_vo\_data* pointer to a empty VoData structure that should be filled

*src\_vo\_data* pointer to the VoData structure that should be copied

**Return values:**

*0* success

*-1* failure (either *src\_vo\_data* or *dst\_vo\_data* was empty)

Definition at line 263 of file lcm maps\_vo\_data.c.

**8.36.2.4 lcm maps\_copyVoMapping (lcm maps\_vo\_mapping\_t \* dst\_vo\_mapping, const lcm maps\_vo\_mapping\_t \* src\_vo\_mapping)**

Copy a VoMapping structure into an empty VoMapping structure.

Copy a VoMapping structure into an empty VoMapping structure which has to exist.

**Parameters:**

*dst\_vo\_mapping* pointer to a empty VoMapping structure that should be filled

*src\_vo\_mapping* pointer to the VoMapping structure that should be copied

**Return values:**

- 0* success
- 1* failure (either *src\_vo\_mapping* or *dst\_vo\_mapping* was empty)

Definition at line 736 of file *lcmaps\_vo\_data.c*.

**8.36.2.5 lcms\_createVoData (const char \* *vo*, const char \* *group*, const char \* *subgroup*, const char \* *role*, const char \* *capability*)**

Create a VoData structure.

Create a VoData structure (store a VO, group, (subgroup,) role, capability combination). Allocate the memory. To be freed with [lcmaps\\_deleteVoData\(\)](#).

**Parameters:**

- vo* name of the VO
- group* name of the group
- subgroup* name of the subgroup (ignored for the moment)
- role* the role
- capability* the capability (whatever it is)

**Returns:**

- pointer to the VoData structure or NULL

Definition at line 81 of file *lcmaps\_vo\_data.c*.

**8.36.2.6 lcms\_createVoMapping (const char \* *vo\_data\_string*, const char \* *groupname*, const gid\_t *gid*)**

Create a VoMapping structure.

Create a VoMapping structure store the VO information string (or FQAN) in combination with the corresponding gid. Allocate the memory. To be freed with [lcmaps\\_deleteVoMapping\(\)](#).

**Parameters:**

- vo\_data\_string* the VO information string (or FQAN)
- groupname* the (POSIX) group name
- gid* the (POSIX) GID

**Returns:**

- pointer to the VoMapping structure or NULL

Definition at line 577 of file *lcmaps\_vo\_data.c*.

**8.36.2.7 lcms\_deleteVoData ([lcmaps\\_vo\\_data\\_t](#) \*\* *vo\_data*)**

Delete a VoData structure.

Delete a VoData structure that was previously created with [lcmaps\\_createVoData\(\)](#). The pointer to the VoData structure is finally set to NULL;

**Parameters:**

*vo\_data* pointer to a pointer to a VoData structure

**Return values:**

*0* in case of success

*-1* in case of failure

Definition at line 141 of file lcmapi\_vo\_data.c.

**8.36.2.8 lcmapi\_deleteVoMapping (lcmapi\_vo\_mapping\_t \*\* vo\_mapping)**

Delete a VoMapping structure.

Delete a VoMapping structure that was previously created with [lcmapi\\_createVoMapping\(\)](#). The pointer to the VoMapping structure is finally set to NULL;

**Parameters:**

*vo\_mapping* pointer to a pointer to a VoMapping structure

**Return values:**

*0* in case of success

*-1* in case of failure

Definition at line 631 of file lcmapi\_vo\_data.c.

**8.36.2.9 lcmapi\_printVoData (int debug\_level, const lcmapi\_vo\_data\_t \* vo\_data)**

Print the contents of a VoData structure.

**Parameters:**

*vo\_data* pointer to a VoData structure

*debug\_level* debug\_level for which the contents will be printed

**Returns:**

0 (always)

Definition at line 324 of file lcmapi\_vo\_data.c.

**8.36.2.10 lcmapi\_printVoMapping (int debug\_level, const lcmapi\_vo\_mapping\_t \* vo\_mapping)**

Print the contents of a VoMapping structure.

**Parameters:**

*vo\_mapping* pointer to a VoMapping structure

*debug\_level* debug\_level for which the contents will be printed

**Returns:**

0 (always)

Definition at line 787 of file lcmapi\_vo\_data.c.

**8.36.2.11 lcms\_stringVoData (const lcms\_vo\_data\_t \* *vo\_data*, char \* *buffer*, int *nchars*)**

Cast a VoData structure into a string.

The user of this function should create the buffer of size *nchars* beforehand. In buffer a string like the following will be written: "/VO=fred/GROUP=fred/flintstone/ROLE=director/CAPABILITY=destroy"

Currently the SUBGROUP entry is ignored. Only if the information is present in the VoData structure, it is added to the string. Both data for VO and GROUP are required (might change).

**Parameters:**

*vo\_data* pointer to a VoData structure

*buffer* pointer to character array of size *nchars*

*nchars* size of character array

**Return values:**

*0* in case of success

*-1* in case of failure

Definition at line 392 of file lcms\_vo\_data.c.

## 8.37 lcmaps\_voms.c File Reference

Interface to the LCMAPS plugins.

```
#include "lcmaps_config.h"
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include <openssl/x509.h>
#include "gssapi.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
#include "lcmaps_voms_utils.h"
#include "lcmaps_vo_data.h"
#include "voms_apic.h"
#include "globus_gss_assist.h"
```

### 8.37.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code for the voms plugin (extracts the VOMS info from the certificate). The interface consists of the following functions:

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_voms.c](#).

## 8.38 lcms\_voms\_localaccount.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include "lcmaps_config.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
#include "lcmaps_gridlist.h"
```

### 8.38.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code of the voms\_localaccount plugin

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_voms\\_localaccount.c](#).

## 8.39 lcmapi\_voms\_localgroup.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include <ctype.h>
#include "lcmapi_config.h"
#include "lcmapi_modules.h"
#include "lcmapi_arguments.h"
#include "lcmapi_cred_data.h"
#include "lcmapi_gridlist.h"
```

### 8.39.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code of the voms\_localgroup plugin

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmapi\\_voms\\_localgroup.c](#).

## 8.40 lcms\_voms\_poolaccount.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include "lcmaps_config.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
#include "lcmaps_gridlist.h"
```

### 8.40.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code of the voms\_poolaccount plugin

1. [plugin\\_initialize\(\)](#)
2. [plugin\\_run\(\)](#)
3. [plugin\\_terminate\(\)](#)
4. [plugin\\_introspect\(\)](#)

Definition in file [lcmaps\\_voms\\_poolaccount.c](#).

## 8.41 lcmaps\_voms\_poolgroup.c File Reference

Interface to the LCMAPS plugins.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <pwd.h>
#include <ctype.h>
#include "lcmaps_config.h"
#include "lcmaps_modules.h"
#include "lcmaps_arguments.h"
#include "lcmaps_cred_data.h"
#include "lcmaps_gridlist.h"
```

### Functions

- int [plugin\\_initialize](#) (int argc, char \*\*argv)  
*initialize the plugin.*
- int [plugin\\_introspect](#) (int \*argc, [lcmaps\\_argument\\_t](#) \*\*argv)  
*Plugin asks for required arguments.*
- int [plugin\\_run](#) (int argc, [lcmaps\\_argument\\_t](#) \*argv)  
*Gather credentials for user making use of the ordered arguments.*
- int [plugin\\_terminate](#) ()  
*Whatever is needed to terminate the plugin module goes in here.*

### 8.41.1 Detailed Description

Interface to the LCMAPS plugins.

**Author:**

Martijn Steenbakkens for the EU DataGrid.

This file contains the code of the voms\_poolgroup plugin

1. [plugin\\_initialize](#)()
2. [plugin\\_run](#)()
3. [plugin\\_terminate](#)()
4. [plugin\\_introspect](#)()

Definition in file [lcmaps\\_voms\\_poolgroup.c](#).

## 8.41.2 Function Documentation

### 8.41.2.1 int plugin\_initialize (int argc, char \*\* argv)

initialize the plugin.

[plugin\\_initialize](#)(int argc, char \*\*argv)

Everything that is needed to initialize the plugin should be put inside this function. Arguments as read from the LCMAPS database (argc, argv) are passed to the plugin.

**Parameters:**

*argc* number of passed arguments.

*argv* argument list. argv[0] contains the name of the plugin.

**Return values:**

*LCMAPS\_MOD\_SUCCESS* successful initialization

*LCMAPS\_MOD\_FAIL* failure in the plugin initialization

*LCMAPS\_MOD\_NOFILE* private plugin database could not be found (same effect as LCMAPS\_MOD\_FAIL)

Definition at line 197 of file lcms\_voms\_poolgroup.c.

### 8.41.2.2 int plugin\_introspect (int \* argc, lcms\_argument\_t \*\* argv)

Plugin asks for required arguments.

[plugin\\_introspect](#)(int \*argc, lcms\_argument\_t \*\*argv)

**Parameters:**

*int* \*argc

*lcms\_argument\_t* \*\*argv

**Return values:**

*LCMAPS\_MOD\_SUCCESS* success

*LCMAPS\_MOD\_FAIL* failure (will result in a lcms failure)

Definition at line 293 of file lcms\_voms\_poolgroup.c.

### 8.41.2.3 int plugin\_run (int argc, lcms\_argument\_t \* argv)

Gather credentials for user making use of the ordered arguments.

[plugin\\_run](#)(int argc, lcms\_argument\_t \*argv)

Ask for credentials by passing the arguments (like JDL, globus DN, VOMS roles etc.) that were ordered earlier by the [plugin\\_introspect](#)() function

**Parameters:**

*argc* number of arguments

*argv* list of arguments

**Return values:**

*LCMAPS\_MOD\_SUCCESS* authorization succeeded

*LCMAPS\_MOD\_FAIL* authorization failed

Definition at line 325 of file lcmads\_voms\_poolgroup.c.

**8.41.2.4 int plugin\_terminate ()**

Whatever is needed to terminate the plugin module goes in here.

[plugin\\_terminate\(\)](#)

**Return values:**

*LCMAPS\_MOD\_SUCCESS* success

*LCMAPS\_MOD\_FAIL* failure (will result in an authorization failure)

Definition at line 526 of file lcmads\_voms\_poolgroup.c.

## 8.42 pdl.h File Reference

General include file.

```
#include <stdio.h>
```

### Data Structures

- struct [plugin\\_s](#)  
*Structure holds a plugin name and its arguments, as well as the line number the plugin is first mentioned.*
- struct [record\\_s](#)  
*Structure is used to keep track of strings and the line they appear on.*

### Defines

- #define [TRUE](#) 1

### Typedefs

- typedef [record\\_s](#) [record\\_t](#)  
*Structure is used to keep track of strings and the line they appear on.*
- typedef [plugin\\_s](#) [plugin\\_t](#)

- const char \* [pdl\\_next\\_plugin](#) ([plugin\\_status\\_t](#) status)

### 8.42.1 Detailed Description

General include file.

In this include file all general "things" can be found.

**Author:**

G.M. Venekamp ([venekamp@nikhef.nl](mailto:venekamp@nikhef.nl))

**Version:**

**Revision:**

1.14

**Date:**

**Date:**

2003/09/11 11:20:28

Definition in file [pdl.h](#).

### 8.42.2 Define Documentation

#### 8.42.2.1 #define TRUE 1

The evaluation manager defines its own boolean type. It first undefines any existing type definitions before it defines it itself.

Definition at line 44 of file [pdl.h](#).

Referenced by [\\_add\\_policy](#), [\\_add\\_variable](#), [check\\_policies\\_for\\_recursion](#), [check\\_rule\\_for\\_recursion](#), [free\\_path](#), [getPluginNameAndArgs](#), [make\\_list](#), [pdl\\_init](#), [reduce\\_policies](#), [reduce\\_to\\_var](#), and [warning](#).

### 8.42.3 Typedef Documentation

#### 8.42.3.1 typedef struct [plugin\\_s](#) plugin\_t

Structure holds a plugin name and its arguments, as well as the line number the plugin is first mentioned.

#### 8.42.3.2 typedef struct [record\\_s](#) record\_t

Structure is used to keep track of strings and the line they appear on.

When lex finds a match, this structure is used to keep track of the relevant information. The matching string as well as the line number are saved. The line number can be used for later references when an error related to the symbol has occurred. This allows for easier debugging of the configuration file.

### 8.42.4 Enumeration Type Documentation

#### 8.42.4.1 enum [pdl\\_error\\_t](#)

Different levels of error logging.

**Enumeration values:**

- PDL\_UNKNOWN** Unknown error level.
- PDL\_INFO** Informational level.
- PDL\_WARNING** Warning level.
- PDL\_ERROR** Error level.
- PDL\_SAME** Repeat the previous level.

Definition at line 52 of file pdl.h.

Referenced by warning.

#### 8.42.4.2 enum plugin\_status\_t

Guide the selection of the next plugin.

**Enumeration values:**

- EVALUATION\_START** The evaluation process has just started.
- EVALUATION\_SUCCESS** The evaluation of the plugin was successful.
- EVALUATION\_FAILURE** The evaluation of the plugin was unsuccessful.

Definition at line 65 of file pdl.h.

Referenced by pdl\_next\_plugin, and runEvaluationManager.

### 8.42.5 Function Documentation

#### 8.42.5.1 record\_t\* concat\_strings (record\_t \* s1, record\_t \* s2)

Concatenate two strings. The original two strings are freed. When the concatenation fails, the original strings are still freed. The actual concatenation is done by [\\_concat\\_strings\(\)](#).

**Parameters:**

- s1* First string.
- s2* Second string

**Returns:**

Concatenated strings of s1 + s2.

Definition at line 405 of file pdl\_main.c.

#### 8.42.5.2 record\_t\* concat\_strings\_with\_space (record\_t \* s1, record\_t \* s2)

Concatenate two strings. The original two strings are freed. When the concatenation fails, the original strings are still freed. The actual concatenation is done by [\\_concat\\_strings\(\)](#).

**Parameters:**

- s1* First string.
- s2* Second string

**Returns:**

Concatenated strings of s1 + s2.

Definition at line 460 of file pdl\_main.c.

#### 8.42.5.3 void free\_resources (void)

Free the resources.

Definition at line 622 of file pdl\_main.c.

Referenced by stopEvaluationManager.

#### 8.42.5.4 const plugin\_t\* get\_plugins (void)

Get a list of plugins as known by the configuration file.

**Returns:**

Plugin list (linked list).

Definition at line 146 of file pdl\_main.c.

Referenced by getPluginNameAndArgs.

#### 8.42.5.5 int pdl\_init (const char \* name)

Init the pdl engine. The function takes one arguments, the name of a configuration file to use.

**Parameters:**

*name* Name of the configuration file to use.

**Returns:**

0 in case the initialization is successful; -1 in case of not being successful.

Definition at line 86 of file pdl\_main.c.

#### 8.42.5.6 const char\* pdl\_next\_plugin (plugin\_status\_t status)

Find the next plugin to evaluate based on the return status of the previous plugin evaluation. There are three statuses, two of which are rather obvious: either the previous evaluation has succeeded (EVALUATION\_SUCCESS), or it has failed (EVALUATION\_FAILURE). Based on these results, the next plugin should be the true\_branch or false\_branch respectively. There is one situation where there is no previous evaluation and that is at the very beginning. The very first call to this function should have (EVALUATION\_START) as arguments. In this case the current state of the rule is returned as the next plugin to evaluate.

**Parameters:**

*status* Status of previous evaluation.

**Returns:**

plugin name to be evaluation according to the configuration file.

Definition at line 510 of file pdl\_main.c.

#### 8.42.5.7 const char\* pdl\_path (void)

Get the path.

**Returns:**

Path.

Definition at line 318 of file pdl\_main.c.

Referenced by `getPluginNameAndArgs`, and `pdl_next_plugin`.

**8.42.5.8 void set\_path (record\_t \* path)**

Function is called when the parser has found the value of the reserved path word. This function acts as a wrapper for the `_set_path()` function.

**Parameters:**

*path*

Definition at line 348 of file pdl\_main.c.

**8.42.5.9 void warning (pdl\_error\_t error, const char \* s, ...)**

Display a warning message.

**Parameters:**

*error* Severity of the error.

*s* The text string.

... Additional values; much like `printf(char *, ...)`;

Definition at line 658 of file pdl\_main.c.

**8.42.5.10 int yyerror (const char \* s)**

When yacc encounters an error during the parsing process of the configuration file, it calls `yyerror()`. The actual message formatting is done in `waring()`;

**Parameters:**

*s* error string.

Definition at line 331 of file pdl\_main.c.

**8.42.5.11 int yyparse\_errors (void)**

Tell if there were errors/warning during parsing.

**Returns:**

0, if there are no errors/warnings, -1 otherwise.

Definition at line 134 of file pdl\_main.c.

Referenced by `startEvaluationManager`.

### 8.43.2 Function Documentation

#### 8.43.2.1 `record_t * _concat_strings (const record_t * s1, const record_t * s2, const char * extra)`

Concatenate two string.

**Parameters:**

- s1* first half of the string.
- s2* second half of the string.

**Returns:**

new string which is the concatenation of *s1* and *s2*.

Definition at line 426 of file `pdl_main.c`.

References `PDL_ERROR`, `record_s::string`, and `warning`.

Referenced by `concat_strings`, and `concat_strings_with_space`.

**8.43.2.2 void \_set\_path (const record\_t \* path)**

Overwrite the default path with the new value. If this function is called more than once, a warning message is displayed for each occurrent.

**Parameters:**

- path* The new path.

Definition at line 365 of file `pdl_main.c`.

References `default_path`, `record_s::lineno`, `path`, `path_lineno`, `PDL_ERROR`, `record_s::string`, and `warning`.

Referenced by `set_path`.

**8.43.2.3 record\_t\* concat\_strings (record\_t \* s1, record\_t \* s2)**

Concatenate two strings. The original two strings are freed. When the concatenation fails, the original strings are still freed. The actual concatenation is done by `_concat_strings()`.

**Parameters:**

- s1* First string.
- s2* Second string

**Returns:**

Concatenated strings of *s1* + *s2*.

Definition at line 405 of file `pdl_main.c`.

References `_concat_strings`, and `record_s::string`.

**8.43.2.4 record\_t\* concat\_strings\_with\_space (record\_t \* s1, record\_t \* s2)**

Concatenate two strings. The original two strings are freed. When the concatenation fails, the original strings are still freed. The actual concatenation is done by `_concat_strings()`.

**Parameters:**

- s1* First string.
- s2* Second string

**Returns:**

Concatenated strings of *s1* + *s2*.

Definition at line 460 of file pdl\_main.c.

References `_concat_strings`, and `record_s::string`.

#### 8.43.2.5 `int find_first_space (const char * string)`

Find the first occurrence of a space in a string.

##### Parameters:

*string* String where the first space needs to be found.

##### Returns:

Position of the first occurrence of the space. If no space could be found, the position is set to the length of the string.

Definition at line 301 of file pdl\_main.c.

Referenced by `plugin_exists`.

#### 8.43.2.6 `void free_path (void)`

Free the string allocated to hold the path

Definition at line 384 of file pdl\_main.c.

References `default_path`, `path`, and `TRUE`.

Referenced by `free_resources`.

#### 8.43.2.7 `void free_resources (void)`

Free the resources.

Definition at line 622 of file pdl\_main.c.

References `free_path`, `free_policies`, `free_variables`, and `script_name`.

#### 8.43.2.8 `policy_t* get_current_policy (void)`

Return the current policy.

Definition at line 72 of file pdl\_main.c.

Referenced by `runEvaluationManager`.

#### 8.43.2.9 `const plugin_t* get_plugins (void)`

Get a list of plugins as known by the configuration file.

##### Returns:

Plugin list (linked list).

Definition at line 146 of file pdl\_main.c.

References `FALSE_BRANCH`, `rule_s::false_branch`, `get_policies`, `policy_s::name`, `policy_s::next`, `rule_s::next`, `policies_have_been_reduced`, `policy_s::rule`, `STATE`, `rule_s::state`, `TRUE_BRANCH`, and `rule_s::true_branch`.

#### 8.43.2.10 `int pdl_init (const char * name)`

Init the pdl engine. The function takes one arguments, the name of a configuration file to use.

**Parameters:**

*name* Name of the configuration file to use.

**Returns:**

0 in case the initialization is successful; -1 in case of not being successful.

Definition at line 86 of file pdl\_main.c.

References plugin\_s::args, d\_path, default\_path, level\_str, plugin\_s::name, plugin\_s::next, parse\_error, path, PDL\_ERROR, PDL\_INFO, PDL\_UNKNOWN, PDL\_WARNING, script\_name, TRUE, and warning.

Referenced by startEvaluationManager.

#### 8.43.2.11 `const char* pdl_next_plugin (plugin_status_t status)`

Find the next plugin to evaluate based on the return status of the previous plugin evaluation. There are three statuses, two of which are rather obvious: either the previous evaluation has succeeded (EVALUATION\_SUCCESS), or it has failed (EVALUATION\_FAILURE). Based on these results, the next plugin should be the true\_branch or false\_branch respectively. There is one situation where there is no previous evaluation and that is at the very beginning. The very first call to this function should have (EVALUATION\_START) as arguments. In this case the current state of the rule is returned as the next plugin to evaluate.

**Parameters:**

*status* Status of previous evaluation.

**Returns:**

plugin name to be evaluation according to the configuration file.

Definition at line 510 of file pdl\_main.c.

References EVALUATION\_FAILURE, EVALUATION\_START, EVALUATION\_SUCCESS, rule\_s::false\_branch, get\_policies, policy\_s::name, policy\_s::next, PDL\_ERROR, pdl\_path, plugin\_status\_t, resetCredentialData, policy\_s::rule, rule\_s::state, rule\_s::true\_branch, and warning.

Referenced by runEvaluationManager.

#### 8.43.2.12 `const char* pdl_path (void)`

Get the path.

**Returns:**

Path.

Definition at line 318 of file pdl\_main.c.

References path.

#### 8.43.2.13 `BOOL plugin_exists (const char * string)`

Check if a plugin as specified by the string argument exists.

**Parameters:**

*string* Name of the plugin.

**Returns:**

TRUE if the plugin exists, FALSE otherwise.

Definition at line 199 of file pdl\_main.c.

References find\_first\_space.

**8.43.2.14 void reduce\_policies (void)**

Reduce\_policies to its elementary form, i.e. each policy has a list of rules which need to be reduced.

Definition at line 206 of file pdl\_policy.c.

References plugin\_s::args, plugin\_s::name, plugin\_s::next, and TRUE.

Referenced by startEvaluationManager.

**8.43.2.15 void set\_path (record\_t \* path)**

Function is called when the parser has found the value of the reserved path word. This function acts as a wrapper for the [\\_set\\_path\(\)](#) function.

**Parameters:**

*path*

Definition at line 348 of file pdl\_main.c.

References \_set\_path, path, and record\_s::string.

**8.43.2.16 void warning (pdl\_error\_t error, const char \* s, ...)**

Display a warning message.

**Parameters:**

*error* Severity of the error.

*s* The text string.

... Additional values; much like printf(char \*, ...);

Definition at line 658 of file pdl\_main.c.

References level\_str, lineno, parse\_error, PDL\_ERROR, pdl\_error\_t, PDL\_SAME, PDL\_UNKNOWN, script\_name, and TRUE.

Referenced by \_add\_policy, \_add\_rule, \_add\_variable, \_concat\_strings, \_set\_path, check\_rule\_for\_recursion, has\_recursion, pdl\_init, pdl\_next\_plugin, reduce\_to\_var, and yyerror.

**8.43.2.17 int yyerror (const char \* s)**

When yacc encounters an error during the parsing process of the configuration file, it calls [yyerror\(\)](#). The actual message formatting is done in [warning\(\)](#);

**Parameters:**

*s* error string.

Definition at line 331 of file pdl\_main.c.

References PDL\_ERROR, and warning.

**8.43.2.18 int yyparse\_errors (void)**

Tell if there were errors/warning during parsing.

**Returns:**

0, if there are no errors/warnings, -1 otherwise.

Definition at line 134 of file pdl\_main.c.

References parse\_error.

*Tell if reduce\_policy() has been called.*

### 8.44.1 Detailed Description

Implementation of the pdl policies.

**Author:**

G.M. Venekamp ([venekamp@nikhef.nl](mailto:venekamp@nikhef.nl))

**Version:**

**Revision:**

1.15

**Date:**

**Date:**

2004/10/01 15:17:31

Definition in file [pdl\\_policy.c](#).

## 8.44.2 Function Documentation

### 8.44.2.1 **BOOL** `_add_policy` (const **record\_t** \* *name*, const **rule\_t** \* *rules*)

Add a policy with its rules to the list of policies.

Before the policy name is actually added to list of policies, a check is made to see whether or not a policy by the same name exists. If it does, the policy name will not be added and an error message is displayed, letting the user know that the configuration file contains multiple policy rules with the same name.

**Parameters:**

*name* Name of the new policy.

*rules* List of associated rules for the policy.

**Returns:**

TRUE, If the policy has been added successfully; FALSE otherwise.

Definition at line 107 of file `pdl_policy.c`.

References `allow_rules`, `find_policy`, `record_s::lineno`, `policy_s::lineno`, `policy_s::name`, `policy_s::next`, `PDL_ERROR`, `policy_s::prev`, `policy_s::rule`, `record_s::string`, TRUE, and `warning`.

Referenced by `add_policy`.

### 8.44.2.2 **void** `add_policy` (**record\_t** \* *policy*, **rule\_t** \* *rules*)

Wrapper around the `_add_policy(name)` function.

When the `_add_policy()` call fails, this function cleans up the data structure allocated for holding information about the policy that was found. See `_add_policy()` for information about the kind of reasons it can fail.

**Parameters:**

*name* Name of the policy.

*rules* List of associated rules for the policy.

Definition at line 73 of file `pdl_policy.c`.

References `_add_policy`, `add_policy`, `start_new_rules`, and `record_s::string`.

Referenced by `add_policy`.

### 8.44.2.3 **void** `allow_rules` (**BOOL** *allow*)

Allow or disallow the additions of rules depending on the argument. When for example a policy is defined for the second time, an error should be generated, but the parsing should still continue. However, no rules can be added to the policy as there is currently no policy defined.

**Parameters:**

*allow* TRUE if addition of new rules is allowed, FALSE otherwise.

Definition at line 55 of file `pdl_policy.c`.

References `allow_rules`.

Referenced by `_add_policy`, and `allow_rules`.

#### 8.44.2.4 **BOOL** `check_policies_for_recursion` (void)

Check for recursions in the policy rules.

**Returns:**

TRUE if at least one recursion has been found, FALSE otherwise.

Definition at line 179 of file pdl\_policy.c.

References `get_policies`, `policy_s::name`, `policy_s::next`, `policy_s::rule`, and `TRUE`.

Referenced by `startEvaluationManager`.

#### 8.44.2.5 `policy_t*` `find_policy` (const char \* *name*)

Find a policy based.

**Parameters:**

*name* Name of the policy to be found. \return The policy if a policy with name 'name' exists, 0 otherwise.

Definition at line 160 of file pdl\_policy.c.

References `find_policy`, `policy_s::name`, and `policy_s::next`.

Referenced by `_add_policy`, and `find_policy`.

#### 8.44.2.6 **void** `free_policies` (void)

Free all policies and their allocated resources.

Definition at line 260 of file pdl\_policy.c.

References `policy_s::name`, `policy_s::next`, and `policy_s::rule`.

Referenced by `free_resources`.

#### 8.44.2.7 `policy_t*` `get_policies` (void)

Get the list of policies.

**Returns:**

First policy in the list.

Definition at line 233 of file pdl\_policy.c.

Referenced by `check_policies_for_recursion`, `get_plugins`, `pdl_next_plugin`, and `reduce_policies`.

#### 8.44.2.8 **BOOL** `policies_have_been_reduced` (void)

Tell if the `reduce_policy()` call has been called.

**Returns:**

TRUE if `reduce_policy()` has been called; FALSE otherwise.

Definition at line 282 of file pdl\_policy.c.

References policies\_reduced.

Referenced by get\_plugins.

#### **8.44.2.9 void reduce\_policies (void)**

Reduce\_policies to its elementary form, i.e. each policy has a list of rules which need to be reduced.

Definition at line 206 of file pdl\_policy.c.

References get\_policies, policy\_s::next, rule\_s::next, policies\_reduced, policy\_s::rule, and TRUE.

#### **8.44.2.10 void remove\_policy (record\_t \* policy)**

Remove a policy from the list of policies and free all associated resources of the policy.

##### **Parameters:**

*name* Policy to be removed.

Definition at line 146 of file pdl\_policy.c.

References remove\_policy, and record\_s::string.

Referenced by remove\_policy.

#### **8.44.2.11 void show\_policies (void)**

Display the policies and the rules associated with the policy.

Definition at line 243 of file pdl\_policy.c.

References policy\_s::name, policy\_s::next, and policy\_s::rule.

## 8.45 pdl\_policy.h File Reference

Definition in file [pdl\\_rule.c](#).

## 8.46.2 Function Documentation

### 8.46.2.1 [rule\\_t](#) \* [\\_add\\_rule](#) (const [record\\_t](#) \* *state*, const [record\\_t](#) \* *true\_branch*, const [record\\_t](#) \* *false\_branch*)

Rules come in three different forms:

1.  $a \rightarrow b$
2.  $a \rightarrow b \mid c$
3.  $\sim a \rightarrow b$

They share a common structure. First the left hand side gives the starting state and right hand side the states to transit to. This means that each rule has a starting state and depending on the form one or two transit states:

- The first form has only the true transit state;
- The second form had both true and false transit states;
- The third form has only the false transit state. When either the true or false transit state for a rule does not exist, 0 should be supplied.

**Parameters:**

*state* Starting state

*true\_branch* True transit state

*false\_branch* False transit state

**Returns:**

TRUE if the rule has been added successfully, FALSE otherwise.

Definition at line 144 of file [pdl\\_rule.c](#).

References [rule\\_s::false\\_branch](#), [record\\_s::lineno](#), [rule\\_s::lineno](#), [policy\\_s::lineno](#), [rule\\_s::next](#), [PDL\\_ERROR](#), [rule\\_s::state](#), [record\\_s::string](#), [rule\\_s::true\\_branch](#), and [warning](#).

Referenced by [add\\_rule](#).

### 8.46.2.2 [rule\\_t](#) \* [add\\_rule](#) ([record\\_t](#) \* *state*, [record\\_t](#) \* *true\_branch*, [record\\_t](#) \* *false\_branch*)

Add a new rule to the list of rules. This function acts as a wrapper function for [\\_add\\_rule\(\)](#).

**Parameters:**

*state* Starting state

*true\_branch* True transit state

*false\_branch* False transit state

Definition at line 86 of file pdl\_rule.c.

References `_add_rule`, `add_rule`, and `record_s::string`.

Referenced by `add_rule`.

#### 8.46.2.3 void allow\_new\_rules (BOOL allow)

Is it allowed to add new rules?

**Parameters:**

*allows* TRUE if adding new rules is allowed, FALSE otherwise.

Definition at line 71 of file pdl\_rule.c.

References `allow_new_rules`.

Referenced by `allow_new_rules`.

#### 8.46.2.4 BOOL check\_rule\_for\_recursion (const rule\_t \* rule)

Check the rule for occurrences of recursion.

**Returns:**

TRUE if a recursion have been found, FALSE otherwise.

Definition at line 220 of file pdl\_rule.c.

References `check_rule_for_recursion`, `count_rules`, `get_rule_number`, `has_recursion`, `rule_s::lineno`, `PDL_WARNING`, `RECURSION`, `recursion_t`, `TRUE`, and `warning`.

Referenced by `check_rule_for_recursion`.

#### 8.46.2.5 unsigned int count\_rules (const rule\_t \* rule)

Count the number of rules that follow 'rule' inclusive.

**Parameters:**

*rule* The rule to start count from.

**Returns:**

Number of counted rules.

Definition at line 257 of file pdl\_rule.c.

References `rule_s::next`.

Referenced by `check_rule_for_recursion`.

#### 8.46.2.6 int find\_insert\_position (const int \* list, const int rule\_number, unsigned int high)

Based on a sorted list, find the position where to insert an new element without disturbing the ordering in the list. The search is a binary search.

**Parameters:**

*list* List of sorted numbers.

*rule\_number* Number to be inserted.

*high* Element number of last element in the list.

**Returns:**

Position of insertion.

Definition at line 488 of file pdl\_rule.c.

References rule\_number.

Referenced by make\_list, and update\_list.

**8.46.2.7 const rule\_t \* find\_state (const rule\_t \* rule, const char \* state)**

Find a state with name state.

**Parameters:**

*state* Name of the state to be found.

**Returns:**

Rule which contains the state or 0 when no such rule could be found.

Definition at line 202 of file pdl\_rule.c.

References rule\_s::next, and rule\_s::state.

**8.46.2.8 void free\_rules (rule\_t \* rule)**

Free all resource associated with the rule.

**Parameters:**

*rule* Rule for which the resources must be freed.

Definition at line 637 of file pdl\_rule.c.

References rule\_s::false\_branch, free\_rules, rule\_s::next, rule\_s::state, and rule\_s::true\_branch.

Referenced by free\_rules.

**8.46.2.9 const rule\_t \* get\_rule\_number (unsigned int rule\_num)**

Give the position of the rule in the policy, return that rule.

**Parameters:**

*rule\_num* Position of the rule in the current policy.

**Returns:**

Rule that is associated with the rule\_num, NULL if the rule cannot be found.

Definition at line 278 of file pdl\_rule.c.

References rule\_s::next.

Referenced by check\_rule\_for\_recursion.

**8.46.2.10** `const rule_t* get_top_rule (void)`

Get the top rule.

**Returns:**

Top rule.

Definition at line 658 of file pdl\_rule.c.

**8.46.2.11** `recursion_t has_recursion (const rule_t * rule, int * list, unsigned int depth, unsigned int * seen_rules)`

Check the a rule for recursion. This is done in a recursive manner. From the top rule, all possible paths are considered. Each path becomes a top of its own and from their all possible paths are traveled. Each time the tree is searched at a greater depth, a list is kept to tell which states have been seen for the current path. In this list of states no duplicates should be present. If a seen state already appears in the list, the path taken is recursive. This information is propagated back up the traveled tree.

At the same time another list is maintained. In this list all visited states are remembered. Duplicates are not added. When all possible paths have been traveled, the list tells all visited rules. When a particular rule is not part of the tree, it is also not listed in the list. This way one can check for disconnected rules.

**Parameters:**

*rule* Rule to check for recursion.

*list* List to keep track of each traveled path.

*depth* Current depth of the tree.

*seen\_rules* Rules that have been visited and hence are part of the path.

**Returns:**

Whether or not recursion has been detected and also if it has been reported.

Definition at line 318 of file pdl\_rule.c.

References `rule_s::false_branch`, `rule_s::lineno`, `make_list`, `NO_RECURSION`, `PDL_ERROR`, `RECURSION`, `RECURSION_HANDLED`, `recursion_t`, `rule_number`, `rule_s::state`, `rule_s::true_branch`, `update_list`, and `warning`.

Referenced by `check_rule_for_recursion`.

**8.46.2.12** `BOOL make_list (int * new_list, const int * list, const int rule_number, const unsigned int depth)`

Make a new sorted list based on the current list and the element to be inserted. The element will only be added to the list if it is not already present.

**Parameters:**

*new\_list* New list after sorted insertion of new element.

*list* Old list.

*rule\_number* Number to be inserted into the list.

*depth* Current depth of the tree. It is used to determine the number of elements of the list.

**Returns:**

TRUE if element has been added, FALSE otherwise

Definition at line 526 of file pdl\_rule.c.

References find\_insert\_position, rule\_number, and TRUE.

Referenced by has\_recursion.

**8.46.2.13 void reduce\_rule (rule\_t \* rule)**

Reduce a rule to its elementary form, i.e. all variables in the rule are substituted by their respective values.

**Parameters:**

*rule* Rule to reduce.

Definition at line 558 of file pdl\_rule.c.

References FALSE\_BRANCH, rule\_s::false\_branch, reduce\_rule, STATE, rule\_s::state, TRUE\_BRANCH, and rule\_s::true\_branch.

Referenced by reduce\_rule.

**8.46.2.14 unsigned int rule\_number (const rule\_t \* rule)**

Given a rule, find the corresponding position in the policy.

**Parameters:**

*rule* Rule of which the position must be found.

**Returns:**

Position of the rule in the current policy.

Definition at line 425 of file pdl\_rule.c.

References rule\_s::next.

Referenced by find\_insert\_position, has\_recursion, and make\_list.

**8.46.2.15 void set\_top\_rule (const rule\_t \* rule)**

Set the top rule to a new value.

**Parameters:**

*rule* New value of top rule.

Definition at line 670 of file pdl\_rule.c.

References set\_top\_rule.

Referenced by set\_top\_rule.

**8.46.2.16 void show\_rules (const rule\_t \* rule)**

Show a rule and its descendants.

**Parameters:**

*rule* Rule to display.

Definition at line 615 of file pdl\_rule.c.

References rule\_s::false\_branch, rule\_s::next, show\_rules, rule\_s::state, and rule\_s::true\_branch.

Referenced by show\_rules.

**8.46.2.17 void start\_new\_rules (void)**

Start a new list of rules.

Definition at line 58 of file pdl\_rule.c.

Referenced by add\_policy.

**8.46.2.18 void update\_list (unsigned int \* rules, unsigned int rule)**

Update the list that hold the visited rules. This is a sorted list for easy insertion and look-up. Duplicate rules are not inserted. The first element of the list tells the total number of elements that follow.

**Note:**

The list expects rules to be numbered starting from 1. This is because 0 denotes empty cells. The [find\\_insert\\_position\(\)](#) returns numbers starting from 0. This is corrected for in this function.

**Parameters:**

*rules* List of visited rules.

*rule* rule to insert.

Definition at line 453 of file pdl\_rule.c.

References find\_insert\_position.

Referenced by has\_recursion.

## 8.47 pdl\_rule.h File Reference

## 8.47.2 Typedef Documentation

### 8.47.2.1 typedef struct `rule_s` `rule_t`

Structure keeps track of the state and the true/false braches.

## 8.47.3 Enumeration Type Documentation

### 8.47.3.1 enum `recursion_t`

Tell something about recursion in rules.

**Enumeration values:**

**NO\_RECURSION** There is no known recursion.

**RECURSION** Recursion has been found.

**RECURSION\_HANDLED** Recursion has been found and handled/reported.

Definition at line 62 of file `pdl_rule.h`.

Referenced by `check_rule_for_recursion`, and `has_recursion`.

### 8.47.3.2 enum `rule_type_t`

Which type is the current rule.

**Enumeration values:**

**STATE** State.

**TRUE\_BRANCH** True branch.

**FALSE\_BRANCH** False branch.

Definition at line 52 of file `pdl_rule.h`.

Referenced by `reduce_to_var`.

### 8.47.3.3 enum `side_t`

Given a rule, which side of the rule are we working on.

**Enumeration values:**

**left\_side** left side, i.e. state part of the rule.

**right\_side** right side, i.e. either true or false branch.

Definition at line 72 of file `pdl_rule.h`.

## 8.48 pdl\_variable.c File Reference

Implementation of the pdl variables.

```
#include <stdarg.h>

## 8.48.2 Function Documentation

### 8.48.2.1 `BOOL _add_variable (const record\_t * name, const record\_t * value)`

Actual implementation of the `add_variable` call. When the variable has been added the call returns `TRUE`, otherwise its `FALSE`. There can be several reasons for failure:

- Variable already exists;
- Variable refers to itself through a loop;
- No more resources to allocate for variable.

#### Parameters:

*name* Name of the variable to be added.

*value* Value of the variable.

#### Returns:

`TRUE` in case the variable has been added, `FALSE` otherwise.

Definition at line 89 of file `pdl_variable.c`.

References `detect_loop`, `record_s::lineno`, `var_s::lineno`, `var_s::name`, `var_s::next`, `var_s::okay`, `PDL_ERROR`, `PDL_SAME`, `record_s::string`, `TRUE`, `var_s::value`, and `warning`.

Referenced by `add_variable`.

### 8.48.2.2 `void add_variable (record\_t * name, record\_t * value)`

Wrapper function for the `_add_variable()` function call. The hard work is done in the `_add_variable()` call. When that call succeeds only the resources allocated for holding the name and value parameters are freed, i.e. the structures name and value. In case the `_add_variable()` calls fails, the string that is contained within the name and value structures is freed as well.

#### Parameters:

*name* Name of the variable.

*value* Value of the variable.

Definition at line 64 of file `pdl_variable.c`.

References `_add_variable`, `add_variable`, and `record_s::string`.

Referenced by `add_variable`.

### 8.48.2.3 `var\_t * detect_loop (const char * name, const char * value)`

Try to detect a loop in the variable references. When e.g. `a=b`, `b=c` and `c=a`, then the call should detect a loop.

#### Parameters:

*name* Name of the variable.

*value* Value of the variable.

#### Returns:

0 if no loop was detected. When a loop is detected, the first variable in the loop is returned.

Definition at line 193 of file pdl\_variable.c.

References `var_s::next`, and `var_s::value`.

Referenced by `_add_variable`.

#### 8.48.2.4 `var_t * find_variable (const char * name)`

Find a variable based on the variable name. This way the value of a variable can be retrieved.

**Parameters:**

*name* Name of the variable to find.

**Returns:**

Pointer to the corresponding variable, or 0 when not found.

Definition at line 168 of file pdl\_variable.c.

References `var_s::name`, and `var_s::next`.

#### 8.48.2.5 `void free_variables (void)`

Free the resources allocated for the variables.

Definition at line 142 of file pdl\_variable.c.

References `var_s::name`, `var_s::next`, and `var_s::value`.

Referenced by `free_resources`.

#### 8.48.2.6 `var_t* get_variables (void)`

Get a list of all variables in the configure file.

**Returns:**

First variable of the list.

Definition at line 269 of file pdl\_variable.c.

#### 8.48.2.7 `void reduce_to_var (const char ** name, rule_type_t rule_type)`

Reduce the variable to its real value. When a variable has another variable as its value, the variable will be reduced to the value of the refering variable.

**Parameters:**

*name* Name of the variable to be reduced.

**Returns:**

Real value of the redunced variable.

Definition at line 239 of file pdl\_variable.c.

References `left_side`, `var_s::lineno`, `var_s::name`, `var_s::okay`, `PDL_WARNING`, `reduce_to_var`, `right_side`, `rule_type_t`, `STATE`, `TRUE`, `var_s::value`, and `warning`.

Referenced by `reduce_to_var`.

**8.48.2.8 void show\_variables (void)**

Print all variables and their value as described in the configure file to stdout.

Definition at line 280 of file pdl\_variable.c.

References `var_s::name`, `var_s::next`, and `var_s::value`.

## 8.49 pdl\_variable.h File Reference

## Chapter 9

# edg-lcmaps Page Documentation

### 9.1 Job Repository plugin

### 9.2 SYNOPSIS

```
lcmaps_jobrep.mod -vommdir <path> -certdir <path> [server=<MySQL hostname/dns-name>]  
[dsn=<DSN-name>] [port=<port nr.>] [driver=<path/file>] [database=<database-name>]  
[username=<database username>] [password=<database password>] [-jr_config <path/file>]
```

### 9.3 DESCRIPTION

The Job Repository module collects the user, job and user-mapping information when a job has been assigned to a fabric and handled by LCMAPS. This information is stored into a SQL database. It is essential that this information is kept secure due to the nature of the data it stores.

### 9.4 OPTIONS

#### 9.4.1 dsn=<DSN-name>

This will select the Data Source Name (DSN) that has been set in a odbc.ini file. In the odbc.ini file are one or more Database sources described with the needed settings to connect to a database. (Note: also partial connection settings are supported (3rd party support))

#### 9.4.2 server=<dns-name>

specifies the host that has the database to connect to.

#### 9.4.3 port=<port nr.>

specifies the port number on the host to override the default portnumber

---

#### 9.4.4 driver=<path/file>

specifies the path and filename of the shared object distributed by the MyODBC package. ODBC needs a driver file to know what kind of database it will be connecting to.

#### 9.4.5 database=<database-name>

specifies the name of the database that has to be connected to. One machine can host several databases. The default name to fill in is: "JobRepository".

#### 9.4.6 username=<database username>

specifies the database username that the LCMAPS module must use to authorize itself with.

#### 9.4.7 password=<database password>

specifies the database password that the LCMAPS module must use to authorize itself with. (Note: Disadviced to use this in the lcmaps.db file because it is publicly accessible)

#### 9.4.8 -jr\_config <path/file>

The path and file specification leads to the root-only-readable file that should contain the database password (or more things like the username) to prevent that a simple user could comprimse the information that is in the database. There is a specific format for this file. All these database parameters must be semi-colon delimited. The same parameters as states above are used. This means that in the lcmaps.db all these parameters could be in this file. Also that is not really adviced due to practical reasons (shifting of servers for example) then you'll just have to edit one file. The lcmaps.db file in this case. This means that you can mix these parameters as you like between the files. All these parameters are concatinated after each other. When parameters are more then ounce defined the last one in the concatinated string will be effectively used. (default: /opt/edg/etc/lcmaps/jobrep\_config)

#### 9.4.9 -vommdir <path>

This is the same directory as the LCMAPS VOMS Extract module looks at. This where the VO certificates are stored. (default: /etc/grid-security/vommdir/). Note: this parameter can not be used in the jobrep\_config file.

#### 9.4.10 -certdir <path>

This is the same directory as the LCMAPS VOMS Extract module looks at. This where the user certificates end up (temporarily) (default: /etc/grid-security/certificates/). Note: this parameter can not be used in the jobrep\_config file.

## 9.5 afs plugin

## 9.6 SYNOPSIS

```
lcmaps_afs.mod [ -lifetime <hh[:mm[:ss]]> | -server <server> | -port <port> | -cell <cell> | -setpag |  
-gsiklog ]
```

## 9.7 DESCRIPTION

This plugin is an Acquisition and Enforcement Plugin and provides the LCMAPS with afs access. Users must have an accessible afs file syteme somewhere. The plugin can only function when gssklog and gssklogd are installed. Underneath it uses the client program gssklog to get an afs token using the user's proxy. The gssklog client depends on the daemon gssklogd to get the afs token. The daemon must be installed one of the afs servers and hence there is no necessity for it to be installed on the same machine as the gatekeeper or the client side of gssklog. The afs machine must be reachable from the client machine. The gssklogd daemon uses the file /etc/grid-security/afsgid-mapfile for the DN-to-AFSaccount mapping.

## 9.8 OPTIONS

### 9.8.1 -lifetime <ticket lifetime in hh[:mm[:ss]]>

Use this option to specify the maximum lifetime of afs token. gssklog allows a maximum of 720 hours. Defaults to 12 hours.

### 9.8.2 -server <afs server>

Name of the server where gssklogd runs.

### 9.8.3 -port <port>

Port number at which the gssklogd daemon runs. Defaults to 750.

### 9.8.4 -cell <cell>

Cell name.

### 9.8.5 -setpag

Setpag.

### 9.8.6 -gsiklog

Use GSI interface instead of GSS interface

## 9.9 RETURN VALUES

- LCMAPS\_MOD\_SUCCESS : Success
- LCMAPS\_MOD\_FAIL : Failure

## 9.10 ERRORS

## 9.18 ldap enforcement plugin

### 9.19 SYNOPSIS

```
lcmaps_ldap_enf.mod -maxuid <maxuid> -maxpgid <maxpgid> -maxsgid <maxsgid> -hostname  
<hostname> -port <port> [-require_all_groups [yes|no]] -dn_manager <DN> -ldap_pw <path/filename>  
-sb_groups <seachbase> -sb_user <searchbase> -timeout <timeout value>
```

### 9.20 DESCRIPTION

Ldap enforcement plugin will alter the user and group settings in the ldap database, using the user and groups settings provided by the credential acquisition plugins. Note that LDAP has to be used as the source of account information for PAM or NSS and has to be RFC 2307 compliant. (see documentation)

### 9.21 OPTIONS

#### 9.21.1 -maxuid <maxuid>

Maximum number of uids to be used. Strongly advised is to set this to 1.

#### 9.21.2 -maxpgid <maxpgid>

Maximum number of primary gids to be used.

#### 9.21.3 -maxsgid <maxsgid>

Maximum number of (secondary) gids to be used (not including primary group). Advised is to set this to 1.

#### 9.21.4 -hostname <hostname>

The hostname on which the LDAP server is running, e.g. asen.nikhef.nl

#### 9.21.5 -port <port>

The port number to which to connect, e.g. 389

#### 9.21.6 -require\_all\_groups [yes|no]

Specify if all groups set by the PluginManager shall be used. Default is 'yes'

#### 9.21.7 -dn\_manager <DN>

DN of the LDAP manager, e.g. "cn=Manager,dc=root"

**9.21.8 -ldap\_pw <path/filename>**

Path to the file containing the password of the LDAP manager. Note: the mode of the file containing the password must be read-only for root (400), otherwise the plugin will not run.

**9.21.9 -sb\_groups <searchbase>**

Search base for the (secondary) groups, e.g. "ou=LocalGroups, dc=foobar, dc=ough"

**9.21.10 -sb\_user <searchbase>**

Search base for the user, e.g. "ou=LocalUsers, dc=foobar, dc=ough"

**9.21.11 -timeout <timeout value>**

timeout (in seconds) that will be applied to the ldap binding

**9.22 RETURN VALUE**

- LCMAPS\_MOD\_SUCCESS : succes
- LCMAPS\_MOD\_FAIL : failure

**9.23 ERRORS**

See bugzilla for known errors (<http://marianne.in2p3.fr/datagrid/bugzilla/>)

**9.24 SEE ALSO**

[lcmaps\\_localaccount.mod](#), [lcmaps\\_poolaccount.mod](#), [lcmaps\\_posix\\_enf.mod](#), [lcmaps\\_voms.mod](#), [lcmaps\\_voms\\_poolaccount.mod](#), [lcmaps\\_voms\\_poolgroup.mod](#), [lcmaps\\_voms\\_localgroup.mod](#)

## 9.25 localaccount plugin

## 9.26 SYNOPSIS

**lcmaps\_localaccount.mod** [-gridmapfile|-GRIDMAPFILE|-gridmap|-GRIDMAP <location gridmapfile>]

## 9.27 DESCRIPTION

This plugin is an Acquisition Plugin and will provide the LCMAPS system with Local Account credential information. To do this it needs to look up the Distinguished Name (DN) from a user's certificate in the gridmapfile. If this DN is found in the gridmapfile the plugin knows the mapped local (system) account username. By knowing the username of the local account the plugin can gather additional information about this account. The plugin will resolve the UID, GID and all the secondary GIDs. When this has been done and there weren't any problems detected, the plugin will add this information to a datastructure in the Plugin Manager. The plugin will finish its run with a LCMAPS\_MOD\_SUCCESS. This result will be reported to the Plugin Manager which started this plugin and it will forward this result to the Evaluation Manager, which will take appropriate actions for the next plugin to run. Normally this plugin would be followed by an Enforcement plugin that can apply these gathered credentials in a way that is appropriate to a system administration's needs.

## 9.28 OPTIONS

### 9.28.1 -GRIDMAPFILE <gridmapfile>

See [-gridmap](#)

### 9.28.2 -gridmapfile <gridmapfile>

See [-gridmap](#)

### 9.28.3 -GRIDMAP <gridmapfile>

See [-gridmap](#)

### 9.28.4 -gridmap <gridmapfile>

When this option is set it will override the default path of the gridmapfile. It is advised to use an absolute path to the gridmapfile to avoid usage of the wrong file(path).

## 9.29 RETURN VALUES

## 9.32 poolaccount plugin

## 9.33 SYNOPSIS

```
lcmaps_poolaccount.mod [-gridmapfile|-GRIDMAPFILE|-gridmap|-GRIDMAP <location  
gridmapfile>] [-gridmapdir|-GRIDMAPDIR <location gridmapdir>]
```

## 9.34 DESCRIPTION

This plugin is a Acquisition Plugin and will provide the LCMAPS system with Pool Account information. To do this it needs to look up the Distinguished Name (DN) from a user's certificate in the gridmapfile. If this DN is found in the gridmapfile the plugin now knows to which pool of local system accounts the user will be mapped. The poolname (starting with a dot '.') instead of an alphanumeric character) will be converted into the an account from a list of local accounts. This list is located in the *gridmapdir* and is made out of filenames. These filenames correspond to the system poolaccount names. (E.g. if a DN corresponds to .test in the gridmapfile, it will be mapped to test001, test002, etc., which names can be found in the gridmapdir)

If there is no pool account assigned to the user yet, the plugin will get a directory listing of the gridmapdir. This list will contain usernames corresponding to system accounts specially designated for pool accounting. If the plugin resolved the mapping of a certain pool name, let's say '.test', the plugin will look into the directory list and will find the first available file in the list corresponding with 'test' (e.g. 'test001') by checking the number of links to its i-node. If this number is 1, this account is still available. To lease this account a second hard link is created, named after the URL-encoded, decapitalized DN.

When a user returns to this site the plugin will look for the DN of the user (URL encoded) in this directory. If found, the corresponding poolaccount will be assigned to the user.

The plugin will resolve the UID, GID and all the secondary GIDs belonging to the poolaccount. When this has been done and there weren't any problems detected, the plugin will add this information to a datastructure in the Plugin Manager. The plugin will finish its run with a LCMAPS\_MOD\_SUCCESS. This result will be reported to the Plugin Manager which started this plugin and it will forward this result to the Evaluation Manager, which will take appropriate actions for the next plugin to run. Normally this plugin would be followed by an Enforcement plugin that can apply these gathered credentials in a way that is appropriate to a system administration's needs.

## 9.35 OPTIONS

### 9.35.1 -GRIDMAPFILE <gridmapfile>

See [-gridmap](#)

### 9.35.2 -gridmapfile <gridmapfile>

See [-gridmap](#)

### 9.35.3 -GRIDMAP <gridmapfile>

See [-gridmap](#)

### 9.35.4 -gridmap <gridmapfile>

If this option is set, it will override the default path of the gridmapfile. It is advised to use an absolute path to the gridmapfile to avoid usage of the wrong file(path).

### 9.35.5 -GRIDMAPDIR <gridmapdir>

See [-gridmapdir](#)

### 9.35.6 -gridmapdir <gridmapdir>

If this option is set, it will override the default path to the gridmapdir. It is advised to use an absolute path to the gridmapdir to avoid usage of the wrong path.

### 9.35.7 -OVERRIDE\_INCONSISTENCY

See [-override\\_inconsistency](#)

### 9.35.8 -override\_inconsistency

Moving a user from one pool to another (because of a VO change) should only be done by changing the gridmapfile indicating the new pool for this user. If a user has already been mapped previously to a poolaccount, there is a link present between this poolaccount and his DN. In the good old days prior to LCMAPS, a 'pool change' would still result in a mapping to the old pool account, neglecting the administrative changes in the gridmapfile. LCMAPS corrects this behaviour: By default the poolaccount plugin will *fail* if the pool designated by the gridmapfile doesn't match the previously mapped poolaccount leasename. If the site doesn't want a failure on this inconsistency it can turn on this parameter. When the inconsistency is detected the plugin will automatically unlink the previous mapping and will proceed by making a *new* lease from the new pool.

## 9.36 RETURN VALUES

- LCMAPS\_MOD\_SUCCESS : Success
- LCMAPS\_MOD\_FAIL : Failure

## 9.37 ERRORS

See bugzilla for known errors (<http://marianne.in2p3.fr/datagrid/bugzilla/>)

## 9.38 SEE ALSO

[lcmaps\\_localaccount.mod](#), [lcmaps\\_posix\\_enf.mod](#), [lcmaps\\_ldap\\_enf.mod](#), [lcmaps\\_voms.mod](#), [lcmaps\\_voms\\_poolaccount.mod](#), [lcmaps\\_voms\\_poolgroup.mod](#), [lcmaps\\_voms\\_localgroup.mod](#)

## 9.39 posix enforcement plugin

## 9.40 SYNOPSIS

**lcmapi\_posix\_enf.mod** [-maxuid|-MAXUID <number of uids>] [-maxpgid|-MAXPGID <number of primary gids>] [-maxsgid|-MAXSGID <number of secondary gids>]

## 9.41 DESCRIPTION

The Posix Enforcement plugin will enforce (apply) the gathered credentials that are stacked in the data-structure of the Plugin Manager. The plugin will get the credential information that is gathered by one or more Acquisition plugins. This implies that at least one Acquisition should have been run prior to this Enforcement. All of the gathered information will be checked by looking into the 'passwd' file of the system. These files have information about all registered system account and its user groups.

The Posix Enforcent plugin does not validate the secondary GIDs. It does check the existence of the GID and the UID. They must exist although it is not needed that the GID and UID are a pair of each other.

The (BSD/POSIX) functions setreuid(), setregid() and setgroups() are used to change the privileges of the process from root to that of a local user.

## 9.42 OPTIONS

### 9.42.1 -MAXUID <number of uids>

See [-maxuid](#)

### 9.42.2 -maxuid <number of uids>

In principle, this will set the maximum number of allowed UIDs that this plugin will handle, but at the moment only the first UID found will be enforced; the others will be discarded. By setting the value to a maximum there will be a failure raised when the amount of UIDs exceeds the set maximum. Without this value the plugin will continue and will enforce only the first found value in the credential data structure.

### 9.42.3 -MAXPGID <number of primary gids>

See [-maxpgid](#)

### 9.42.4 -maxpgid <number of primary gids>

This will set the maximum number of allowed Primary GIDs that this plugin will handle, similar to [-maxuid](#). Also here only the first primary GID found will be taken into account.

### 9.42.5 -MAXSGID <number of secondary gids>

See [-maxsgid](#)

### 9.42.6 -maxsgid <number of secondary gids>

This will set the maximum allowed Secondary GIDs that this plugin will handle. This number is limited by the system (NGROUPS) and is usually 32. If the plugin cannot determine the system value, it limits itself to 32.

### 9.42.7 -set\_only\_euid [yes|no]

The result of setting this option to 'yes' is that only the effective uid is set. In other words, it is still possible to regain root (uid) privileges for the process. This is definitely undesirable if this module is used from a process like the gatekeeper, since it would be possible for user jobs to get root privileges ! **THIS IS A DANGEROUS OPTION, PLEASE KNOW WHAT YOU'RE DOING !** By default, this option is set to 'no'. Possibly this option should be set if the module is used by gridFTP, since this service does not spawn user jobs and has to regain root privileges at the end.

### 9.42.8 -set\_only\_egid [yes|no]

Analogue to the previous option the result of setting this option to 'yes' is that only the effective (primary) gid is set. In other words, it is still possible to regain root (gid) privileges for the process. This is definitely undesirable if this module is used from a process like the gatekeeper, since it would be possible for user jobs to get root privileges ! **THIS IS A DANGEROUS OPTION, PLEASE KNOW WHAT YOU'RE DOING !** By default, this option is set to 'no'. Possibly this option should be set if the module is used by gridFTP, since this service does not spawn user jobs and has to regain root privileges at the end.

## 9.43 RETURN VALUES

## 9.46 voms plugin

## 9.47 SYNOPSIS

**lcmads\_voms.mod** -vomsdir <vomsdir> -certdir <certdir>

## 9.48 DESCRIPTION

This plugin forms the link between the VOMS data found in the user grid credential (X509 certificate) and the lcmads system. It will retrieve the VOMS data by using the VOMS API. The plugin stores the VOMS data in the LCMAPS process space, where it is accessible by other 'VOMS-aware' plugins, and should, therefore, be evaluated before the other plugins, that actually gather the local credentials based on the VOMS information (e.g. [lcmads\\_voms\\_poolaccount.mod](#), [lcmads\\_voms\\_poolgroup.mod](#) and [lcmads\\_voms\\_localgroup.mod](#)).

## 9.49 OPTIONS

### 9.49.1 -VOMSDIR <vomsdir>

See [-vomsdir](#)

### 9.49.2 -vomsdir <vomsdir>

This is the directory which contains the certificates of the VOMS servers

### 9.49.3 -CERTDIR <certdir>

See [-certdir](#)

### 9.49.4 -certdir <certdir>

This is the directory which contains the CA certificates

## 9.50 RETURN VALUES

- LCMAPS\_MOD\_SUCCESS : Success
- LCMAPS\_MOD\_FAIL : Failure

## 9.51 ERRORS

See bugzilla for known errors (<http://marianne.in2p3.fr/datagrid/bugzilla/>)

## 9.52 SEE ALSO

[lcmads\\_voms\\_poolaccount.mod](#), [lcmads\\_voms\\_poolgroup.mod](#), [lcmads\\_voms\\_localgroup.mod](#) [lcmads\\_localaccount.mod](#), [lcmads\\_poolaccount.mod](#), [lcmads\\_posix\\_enf.mod](#), [lcmads\\_ldap\\_enf.mod](#),

## 9.53 voms local account plugin

## 9.54 SYNOPSIS

```
lcmads_voms_localaccount.mod [-gridmapfile|-GRIDMAPFILE|-gridmap|-GRIDMAP <location  
gridmapfile>] [-use_voms_gid]
```

## 9.55 DESCRIPTION

This localaccount acquisition plugin is a 'VOMS-aware' modification of the 'localaccount' plugin. The plugin tries to find a local account (more specifically a UID) based on the VOMS information that has been retrieved by the plugin [lcmads\\_voms.mod](#) from the user's grid credential. It will try to match a VO-GROUP-ROLE combination from the user's grid credential with an entry in a gridmapfile (most likely the traditional gridmapfile, used by the localaccount and poolaccount plugins) In this file VO-GROUP-ROLE combinations are listed next to the name of an existing account, as shown in the following example.

EXAMPLE:

```
" /VO=wilma/GROUP=management " wilmamgr  
" /VO=fred/GROUP=* " fredmgr
```

If the first matching VO-GROUP-ROLE combination is " /VO=wilma/GROUP=management " the plugin will map the user to the account wilmamgr. If the first matching VO-GROUP-ROLE combination is " /VO=fred/GROUP=\* " the plugin will map the user to the account fredmgr.

## 9.56 NOTE 1

This plugin should only be used in combination with the '*voms\_localgroup*' and/or '*voms\_poolgroup*' plugins.

## 9.57 OPTIONS

### 9.57.1 -GRIDMAPFILE <gridmapfile>

See [-gridmap](#)

### 9.57.2 -gridmapfile <gridmapfile>

See [-gridmap](#)

### 9.57.3 -GRIDMAP <gridmapfile>

See [-gridmap](#)

### 9.57.4 -gridmap <gridmapfile>

When this option is set it will override the default path to the gridmapfile. It is advised to use an absolute path to the gridmapfile to avoid usage of the wrong file(path).

### 9.57.5 -use\_voms\_gid

When this option is set the LCMAPS system relies on other VOMS plugins such as [lcmaps\\_voms\\_localgroup.mod](#) and [voms\\_poolgroup plugin](#) "lcmaps\_voms\_poolgroup.mod" to assign a primary GID based on the VOMS attributes contained in the user proxy instead of taking the default primary GID that comes with the local account.

## 9.58 RETURN VALUES

- LCMAPS\_MOD\_SUCCESS : Success
- LCMAPS\_MOD\_FAIL : Failure

## 9.59 ERRORS

See bugzilla for known errors (<http://marianne.in2p3.fr/datagrid/bugzilla/>)

## 9.60 SEE ALSO

[lcmaps\\_voms.mod](#), [lcmaps\\_voms\\_localgroup.mod](#), [lcmaps\\_voms\\_localgroup.mod](#), [lcmaps\\_voms\\_poolgroup.mod](#), [lcmaps\\_localaccount.mod](#), [lcmaps\\_poolaccount.mod](#), [lcmaps\\_posix\\_enf.mod](#), [lcmaps\\_ldap\\_enf.mod](#),

## 9.61 voms localgroup plugin

## 9.62 SYNOPSIS

**lcmaps\_voms\_localgroup.mod** **-GROUPMAPFILE**|-groupmapfile|-GROUPMAP|-groupmap  
 <groupmapfile> [-mapall] [-mapmin <group count>]

## 9.63 DESCRIPTION

The localgroup acquisition plugin is a 'VOMS-aware' plugin. It uses the VOMS information (acquired by the plugin [lcmaps\\_voms.mod](#)) to gather primary and secondary GIDs. This is accomplished by matching VO-GROUP-ROLE(-CAPABILITY) combinations in the so-called *groupmapfile* (gridmapfile style) and by finding the corresponding local GID. Wildcards can be used in the groupmapfile to match VO-GROUP-ROLE combinations.

EXAMPLE 'groupmapfile':

```
" /VO=atlas/GROUP=mcprod" atmcpod
```

```
" /VO=atlas/GROUP=*" atlasgrps
```

A VO-GROUP combination /VO=atlas/GROUP=mcprod matches " /VO=atlas/GROUP=mcprod", resulting in a mapping to the GID of the 'atmcpod' group. All the other groups within the 'atlas' VO will be mapped to 'atlasgrps'. A user with /VO=cms/GROUP=user will not be mapped to any local system group, unless there will be an extra row in the groupmapfile like ' " /VO=\*" allothers' resulting in a mapping from any other VO-GROUP-ROLE combination to 'allothers'. The mapping is based on the first match found for a VO-GROUP-ROLE combination, implying that the most significant row must be on top.

The poolgroup plugin will try to match each VO-GROUP-ROLE combination that was found by the plugin [lcmaps\\_voms.mod](#). The first VO-GROUP-ROLE combination will become the primary group, the others secondary groups. As the primary GID may be used for auditing and accounting purposes it is important that the user uses the correct ordering of VO-GROUP-ROLE combinations in his grid credential (X509 certificate).

## 9.64 OPTIONS

### 9.64.1 -GROUPMAPFILE <groupmapfile>

See [-groupmap](#)

### 9.64.2 -groupmapfile <groupmapfile>

See [-groupmap](#)

### 9.64.3 -GROUPMAP <groupmapfile>

See [-groupmap](#)

#### 9.64.4 -groupmap <groupmapfile>

If this option is set, it will override the default path to the groupmapfile. It is advised to use an absolute path to the groupmapfile to avoid usage of the wrong file(path).

#### 9.64.5 -mapall

If this parameter is set, the plugin only succeeds if it manages to map all voms data entries to (system) groups and find their GID. There is no communication between different plugins (like the voms\_poolgroup plugin) about the failures. A log entry will state the VO-GROUP-ROLE combination that made the plugin fail.

#### 9.64.6 -mapmin <group count>

This option will set a minimum amount of groups that have to be resolved for later mapping. If the minimum is not set then the minimum amount is set to '0' by default. If the plugin is not able to the required number of local groups it will fail. Note: if the minimum is set to zero or the minimum is not set the plugin will return a success if no other errors occur, even if no local groups were found.

### 9.65 RETURN VALUES

- LCMAPS\_MOD\_SUCCESS : Success
- LCMAPS\_MOD\_FAIL : Failure

### 9.66 ERRORS

See bugzilla for known errors (<http://marianne.in2p3.fr/datagrid/bugzilla/>)

### 9.67 SEE ALSO

[lcmaps\\_voms.mod](#), [lcmaps\\_voms\\_poolaccount.mod](#), [lcmaps\\_voms\\_poolgroup.mod](#), [lcmaps\\_-localaccount.mod](#), [lcmaps\\_poolaccount.mod](#), [lcmaps\\_posix\\_enf.mod](#), [lcmaps\\_ldap\\_enf.mod](#),

## 9.68 voms poolaccount plugin

## 9.69 SYNOPSIS

```
lcmads_voms_poolaccount.mod [-gridmapfile|-GRIDMAPFILE|-gridmap|-GRIDMAP <location  
gridmapfile>] [-gridmapdir|-GRIDMAPDIR <location gridmapdir>] [-do_not_use_secondary_gids]  
[-do_not_require_primary_gid]
```

## 9.70 DESCRIPTION

This poolaccount acquisition plugin is a 'VOMS-aware' modification of the 'poolaccount' plugin. The plugin tries to find a poolaccount (more specifically a UID) based on the VOMS information that has been retrieved by the plugin [lcmads\\_voms.mod](#) from the user's grid credential. It will try to match a VO-GROUP-ROLE combination from the user's grid credential with an entry in a gridmapfile (most likely the traditional gridmapfile, used by the localaccount and poolaccount plugins) In this file VO-GROUP-ROLE combinations are listed with a poolaccount entry, as shown in the following example.

EXAMPLE:

```
" /VO=wilma/GROUP=*" .wilma
```

```
" /VO=fred/GROUP=*" .fred
```

If the first matching VO-GROUP-ROLE combination is " /VO=wilma/GROUP=\*" the plugin will get a poolaccount from the '.test' pool. This could result in 'wilma001' as a poolaccount for this user. The linking between " /VO=wilma/GROUP=\*", this user and a poolaccount must be made in the same directory as the for the 'poolaccount' plugin (the *gridmapdir*), otherwise it gives rise to inconsistencies when both are used on a site. The actual account assigned to the user is based on his VO information matched in the gridmapfile, the user's DN and the primary (and secondary) GIDs gathered so far. In the *gridmapdir* directory this is reflected in the leasename, which consists of the url-encoded DN + a concatenation of the gathered groupnames. So a lease name could look like this:

EXAMPLE DN with pool/localgroups attached: %2fo%3ddutchgrid%2fo%3dusers%2fo%3dnikhef%2fcn%3dmar

If a user changes his VO-GROUP-ROLE combinations (but not his VO), in this case he will be mapped to a different account (UID) within the same pool.

## 9.71 NOTE 1

This plugin should only be used in combination with the 'voms\_localgroup' and/or 'voms\_poolgroup' plugins.

## 9.72 NOTE 2

The options '-do\_not\_require\_primary\_gid' and '-do\_not\_use\_secondary\_gids' can not be used together, because at least one GID is needed.

## 9.73 OPTIONS

### 9.73.1 -GRIDMAPFILE <gridmapfile>

See [-gridmap](#)

### 9.73.2 -gridmapfile <gridmapfile>

See [-gridmap](#)

### 9.73.3 -GRIDMAP <gridmapfile>

See [-gridmap](#)

### 9.73.4 -gridmap <gridmapfile>

When this option is set it will override the default path to the gridmapfile. It is advised to use an absolute path to the gridmapfile to avoid usage of the wrong file(path).

### 9.73.5 -GRIDMAPDIR <gridmapdir>

See [-gridmapdir](#)

### 9.73.6 -gridmapdir <gridmapdir>

If this option is set, it will override the default path to the gridmapdir. It is advised to use an absolute path to the gridmapdir to avoid usage of the wrong path.

### 9.73.7 -do\_not\_use\_secondary\_gids

The determination of the poolaccount will not be based on the secondary GIDs found, but only on the user's DN, the VOMS info for the user and the primary GID that has been found. Cannot be used with [-do\\_not\\_require\\_primary\\_gid](#).

### 9.73.8 -do\_not\_require\_primary\_gid

The determination of the poolaccount will not be based on the primary GID found, but only on the user's DN, the VOMS info for the user and the secondary GIDs found. Normally this option should not be used, but it can be useful for debugging. Cannot be used with [-do\\_not\\_use\\_secondary\\_gids](#).

### 9.73.9 -OVERRIDE\_INCONSISTENCY

See [-override\\_inconsistency](#)

### 9.73.10 -override\_inconsistency

Moving a user from one pool to another (because of a VO change) should only be done by changing the gridmapfile indicating the new pool for this user. If a user has already been mapped previously to a poolaccount, there is a link present between this poolaccount and his DN. In the good old days prior to LCMAPS, a 'pool change' would still result in a mapping to the old pool account, neglecting the administrative changes in the gridmapfile. LCMAPS corrects this behaviour: By default the voms\_poolaccount plugin will *fail* if the pool designated by the gridmapfile doesn't match the previously mapped voms\_poolaccount leasename. If the site doesn't want a failure on this inconsistency it can turn on this parameter. When the inconsistency is detected the plugin will automatically unlink the previous mapping and will proceed by making a *new* lease from the new pool.

## 9.74 RETURN VALUES

- LCMAPS\_MOD\_SUCCESS : Success
- LCMAPS\_MOD\_FAIL : Failure

## 9.75 ERRORS

See bugzilla for known errors (<http://marianne.in2p3.fr/datagrid/bugzilla/>)

## 9.76 SEE ALSO

[lcmaps\\_voms.mod](#), [lcmaps\\_voms\\_localgroup.mod](#), [lcmaps\\_voms\\_poolgroup.mod](#), [lcmaps\\_-localaccount.mod](#), [lcmaps\\_poolaccount.mod](#), [lcmaps\\_posix\\_enf.mod](#), [lcmaps\\_ldap\\_enf.mod](#),

## 9.77 voms poolgroup plugin

## 9.78 SYNOPSIS

```
lcmaps_voms_poolgroup.mod -GROUPMAPFILE|-groupmapfile|-GROUPMAP|-groupmap
<groupmapfile> -GROUPMAPDIR|-groupmapdir <groupmapdir> [-mapall] [-mapmin <group
count>]
```

## 9.79 DESCRIPTION

The poolgroup acquisition plugin is a 'VOMS-aware' plugin. It uses the VOMS information (acquired by the plugin [lcmaps\\_voms.mod](#)) to gather primary and secondary GIDs. This is accomplished by matching VO-GROUP-ROLE(-CAPABILITY) combinations in the so-called *groupmapfile* (gridmapfile style) and by finding the corresponding 'poolgroup' (similar to the 'poolaccount' procedure, see [lcmaps.-poolaccount.mod](#)) Wildcards can be used in the groupmapfile to match VO-GROUP-ROLE combinations.

EXAMPLE 'groupmapfile':

```
"/VO=atlas/GROUP=mcprod" mcprod
"/VO=atlas/GROUP=mcprod" .atlas
"/VO=atlas/GROUP=dev" .atlas
"/VO=atlas/GROUP=*" .atlas
```

The VO-GROUP-ROLE combination `"/VO=atlas/GROUP=mcprod"` starts with an alphanumeric character (not `"."`) and indicates a localgroup entry in the groupmapfile (will be resolved by the [lcmaps.-voms.localgroup.mod](#)). The VO-GROUP-ROLE combination `"/VO=atlas/GROUP=*"` indicates that all users from the Atlas VO with every other group than 'mcprod' will be mapped to the '.atlas' pool of (system) groups. Just like the *poolaccount* plugin this plugin will link an entry (in this case a VO-GROUP-ROLE combination) to a locally known group (a.k.a. poolgroup) in the *groupmapdir* directory. The difference with the *poolaccount* plugin is that there is not a Distinguished Name but a VO-GROUP-ROLE combination and there is no poolaccount but poolgroup defined in the groupmapfile (similar to the gridmapfile). Instead of the *gridmapdir* the *groupmapdir* directory is used for the registration of the mapping between poolgroups and the VO-GROUP-ROLE combination.

As you can see in the example the 'mcprod' GROUP can be found by using the localgroup plugin and the poolgroup plugin. With the poolgroup plugin there can be made a mapping between `"/VO=atlas/GROUP=mcprod"` and the group 'atlas001' (based on the .atlas pool). The entry `"/VO=atlas/GROUP=dev"` will also result in a group from this '.atlas' pool, but a different one, e.g. 'atlas002'. Finally, we have random other groups not predefined in the groupmapfile, for example `"/VO=atlas/GROUP=foo"`, which matches `"/VO=atlas/GROUP=*"` in the groupmapfile. This VO-GROUP combination will be mapped to a poolgroup (probably) called 'atlas003'.

The poolgroup plugin will try to match each VO-GROUP-ROLE combination that was found by the plugin [lcmaps\\_voms.mod](#). The first VO-GROUP-ROLE combination will become the primary group, the others secondary groups. As the primary GID may be used for auditing and accounting purposes it is important that the user uses the correct ordering of VO-GROUP-ROLE combinations in his grid credential (X509 certificate).

## 9.80 OPTIONS

### 9.80.1 -GROUPMAPFILE <groupmapfile>

See [-groupmap](#)

### 9.80.2 -groupmapfile <groupmapfile>

See [-groupmap](#)

### 9.80.3 -GROUPMAP <groupmapfile>

See [-groupmap](#)

### 9.80.4 -groupmap <groupmapfile>

If this option is set, it will override the default path to the groupmapfile. It is advised to use an absolute path to the groupmapfile to avoid usage of the wrong file(path).

### 9.80.5 -GROUPMAPDIR <groupmapdir>

See [-groupmapdir](#)

### 9.80.6 -groupmapdir <groupmapdir>

Here you can override the default directory path to the 'groupmapdir'. This directory is just like the *gridmapdir* and holds all the poolgroup mappings that has/will be made by linking filenames to a i-node indicating a mapping between a VO-GROUP-ROLE combination and a (system) group or GID.

### 9.80.7 -mapall

If this parameter is set, the plugin only succeeds if it manages to map all voms data entries to (system) groups and find their GID. There is no communication between different plugins (like the voms\_localgroup plugin) about the failures. A log entry will state the VO-GROUP-ROLE combination that made the plugin fail.

### 9.80.8 -OVERRIDE\_INCONSISTENCY

See [-override\\_inconsistency](#)

### 9.80.9 -override\_inconsistency

Moving a VO group from one pool to another should only be done by changing the groupmapfile indicating the new pool for this VO group. If a VO group has already been mapped previously to a poolaccount, there is a link present between this poolgroup and its VO-GROUP-ROLE combination. By default the voms.-poolgroup plugin will *fail* if the pool designated by the gridmapfile doesn't match the previously mapped

poolgroup leasename. If the site doesn't want a failure on this inconsistency it can turn on this parameter. When the inconsistency is detected the plugin will automatically unlink the previous mapping and will proceed by making a *new* lease from the new pool.

#### 9.80.10 -mapmin <group count>

This option will set a minimum amount of groups that have to be resolved for later mapping. If the minimum is not set then the minimum amount is set to '0' by default. If the plugin is not able to the required number of poolgroups it will fail. Note: if the minimum is set to zero or the minimum is not set the plugin will return a success if no other errors occur, even if no poolgroups were found.

## 9.81 RETURN VALUES

- LCMAPS\_MOD\_SUCCESS : Success
- LCMAPS\_MOD\_FAIL : Failure

## 9.82 ERRORS

See bugzilla for known errors (<http://marianne.in2p3.fr/datagrid/bugzilla/>)
